Autism Spectrum Disorders (Part 1): Case Finding and Screening

Stephen E. Brock, Ph.D., NCSP
California State University, Sacramento

Michael Slone, M.S., NCSP
Irvine Unified School District
Presentation Outline

- Introduction: Reasons for Increased Vigilance
- Diagnostic Classifications and Special Education Eligibility
- School Psychologist Roles, Responsibilities, and Limitations
- Case Finding
- Screening and Referral
Introduction: Reasons for Increased Vigilance

- Autistic spectrum disorders are much more common than previously suggested.
  - 60 (vs. 4 to 6) per 10,000 in the general population (Chakrabarit & Fombonne, 2001).
  - 600% increase in the numbers served under the autism IDEA eligibility classification (U.S. Department of Education, 2003).
  - 95% of school psychologists report an increase in the number of students with ASD being referred for assessment (Kohrt, 2004).
Increased Prevalence in California

Figure 1. Distribution of birth dates of regional center eligible persons with autism

Report to the Legislature on the Principal Findings from The Epidemiology of Autism in California: A Comprehensive Pilot Study. M.I.N.D. Institute, University of California, Davis. October 17, 2002
Increased Prevalence (CA and U.S.)

Autism Growth Comparison Chart

(Source: Autism Society of America)

- 273% -- Autism (California)³
- 172% -- Autism (U.S.)²
- 16% -- All Disabilities (U.S.)²
- 13% -- U.S. Population¹

Explanations for Changing ASD Rates in the General Population

- Changes in diagnostic criteria.
- Heightened public awareness of autism.
- Increased willingness and ability to diagnose autism.
- Availability of resources for children with autism.
- Yet to be identified environmental factors.

Total Number of Student Classified as Autistic and Eligible Special Education Under IDEA by Age Group

- 6 Š 11 years
- 12 Š 17 years
- 18 Š 21 years

Student Classified as Autistic Under IDEA as a Percentage of Students with Disabilities: 1994 to 2003
Explanations for Changing ASD Rates in Special Education

Classification substitution

- IEP teams have become better able to identify students with autism.
- Autism is more acceptable in today’s schools than is the diagnosis of mental retardation.
- The intensive early intervention services often made available to students with autism are not always offered to the child whose primary eligibility classification is mental retardation.

Percentage of Students Classified as Autistic Mentally Retarded Under IDEA as a Percent of all Students with Disabilities: 1994 to 2003

- % with Autism
- % with MR
Reasons for Increased Vigilance

- Autism can be identified early in development, and...
- Early intervention is an important determinant of the course of autism.
Reasons for Increased Vigilance

- Not all cases of autism will be identified before school entry.
  - Average Age of Autistic Disorder identification is 5 1/2 years of age.
  - Average Age of Asperger’s Disorder identification is 11 years of age.
Reasons for Increased Vigilance

- Most children with autism are identified by school resources.
  - Only three percent of children with ASD are identified solely by non-school resources.
  - All other children are identified by a combination of school and non-school resources (57 %), or by school resources alone (40 %) Yeargin-Allsopp et al. (2003).
Reasons for Increased Vigilance

- Full inclusion of children with ASD in general education classrooms.
  - Students with disabilities are increasingly placed in full-inclusion settings.
  - In addition, the results of recent studies suggesting a declining incidence of mental retardation among the ASD population further increases the likelihood that these children will be mainstreamed (Chakrabarti & Fombonne, 2001).
  - Consequently, today’s educators are more likely to encounter children with autism during their careers.

Autism Spectrum Disorders (ASD)

- A diagnostic category found in DSM IV-TR.
- Placed within the subclass of Disorders Usually First Diagnosed in Infancy, Childhood, or Adolescence known as Pervasive Developmental Disorders (PDD).

PDD includes Autistic Disorder, Asperger’s Disorder, Rett’s Disorder, Childhood Disintegrative Disorder, and PDD Not Otherwise Specified (PDD-NOS).
In this workshop the terms “Autism,” or “Autistic Spectrum Disorders (ASD)” will be used to indicate these PDDs.
Diagnostic Classifications

- **Autistic Disorder**
  - Markedly abnormal or impaired development in social interaction and communication and a markedly restricted repertoire of activity and interests.

- **Asperger’s Disorder**
  - Markedly abnormal or impaired development in social interaction and a markedly restricted repertoire of activities and interests (language abilities and cognitive functioning is not affected).

- **PDD-NOS**
  - Experience difficulty in at least two of the three autistic disorder symptom clusters, but do not meet diagnostic criteria for any other PDD.
Diagnostic Classifications

- **Rett’s Disorder**
  - Occurs primarily among females and involves a pattern of head growth deceleration, a loss of fine motor skill, and the presence of awkward gait and trunk movement.

- **Childhood Disintegrative Disorder**
  - Very rare. A distinct pattern of regression following at least two years of normal development.
Diagnostic Classifications

- DSM IV Criteria
IDEA Autism Classification

P.L. 105-17, Individuals with Disabilities Education Act [IDEA], 1997:

Autism means a developmental disability significantly affecting verbal and nonverbal communication and social interaction, generally evident before age three, that adversely affects a child’s education performance. Other characteristics often associated with autism are engagement in repetitive activities and stereotypical movements, resistance to environmental change or change in daily routines, and unusual responses to sensory experiences. The term does not apply if a child’s educational performance is adversely affected primarily because the child has an emotional disturbance. (sec. 300.7)
Special Education Eligibility

CA Autism Classification

- Title 5, CCR 3030(g):
  - A pupil exhibits any combination of the following autistic-like behaviors, to include but not limited to: (1) an inability to use oral language for appropriate communication; (2) a history of extreme withdrawal or relating to people inappropriately and continued impairment in social interaction from infancy through early childhood; (3) an obsession to maintain sameness; (4) extreme preoccupation with objects or inappropriate use of objects or both; (5) extreme resistance to controls; (6) displays peculiar motoric mannerisms and motility patterns; (7) self-stimulating, ritualistic behavior.
Special Education Eligibility

- For special education eligibility purposes distinctions among PDDs may not be relevant.
- While the diagnosis of Autistic Disorder requires differentiating its symptoms from other PDDs, Shriver et al. (1999) suggest that for special education eligibility purposes “the federal definition of ‘autism’ was written sufficiently broad to encompass children who exhibit a range of characteristics” (p. 539) including other PDDs.
Special Education Eligibility

- However, it is less clear if students with milder forms of ASD are eligible for special education.
- Adjudicative decision makers almost never use the *DSM IV-TR* criteria exclusively or primarily for determining whether the child is eligible as autistic” (Fogt et al., 2003).
- While *DSM IV-TR* criteria are often considered in hearing/court decisions, *IDEA* is typically acknowledged as the “controlling authority.”
- When it comes to special education, it is state and federal education codes and regulations (not *DSM IV-TR*) that drive eligibility decisions.
Presentation Outline

- Introduction: Reasons for Increased Vigilance
- Diagnostic Classifications and Special Education Eligibility
  - School Psychologist Roles, Responsibilities, and Limitations
- Case Finding
- Screening and Referral
School psychologists need to be more vigilant for symptoms of autism among the students that they serve, and better prepared to assist in the process of identifying these disorders.

Case Finding

Autism Screening

Autism Indicated

Diagnostic Assessment

Psych-educational Assessment

YES

NO

Continue to monitor development

Refer for assessment as indicated
Case Finding

- All school psychologists should be expected to participate in case finding (i.e., routine developmental surveillance of children in the general population to recognize risk factors and identify warning signs of autism).
  - This would include training general educators to identify the risk factors and warning signs of autism.
School Psychologist Roles, Responsibilities, and Limitations

- **Screening**
  - *All school psychologists should be prepared to participate in the behavioral screening of the student who has risk factors and/or displays warning signs of autism* (i.e., able to conduct screenings to determine the need for diagnostic assessments).
  
  - *All school psychologists should be able to distinguish between screening and diagnosis.*
School Psychologist Roles, Responsibilities, and Limitations

- Only those school psychologists with appropriate training and supervision should diagnose a specific autism spectrum disorder.

- All school psychologists should be expected to conduct the psycho-educational evaluation that is a part of the diagnostic process and that determines educational needs.
Presentation Outline

- Introduction: Reasons for Increased Vigilance

Case Finding

- **Looking**
  - for risk factors and warning signs of atypical development.

- **Listening**
  - REALLY LISTENING to parental concerns about atypical development.

- **Questioning**
  - caregivers about the child’s development.
Case Finding: Looking for Risk Factors

- **Known Risk Factors**
  - **High Risk**
    - Having an older sibling with autism.
  - **Moderate Risk**
    - The diagnosis of tuberous sclerosis, fragile X, or epilepsy.
    - A family history of autism or autistic-like behaviors.
Currently there is no substantive evidence supporting any one non-genetic risk factor for ASD.

However, given that there are likely different causes of ASD, it is possible that yet to be identified non-heritable risk factors may prove to be important in certain subgroups of individuals with this disorder.

- There may be an interaction between the presence of specific genetic defects and specific environmental factors.
- Individuals with a particular genetic predisposition for ASD may have a greater risk of developing this disorder subsequent to exposure to certain non-genetic risk factors.
- In particular, it has been suggested that prenatal factors such as maternal infection and drug exposure deserve further examination.
Case Finding: Looking for Warning Signs

Infants and Preschoolers

Absolute indications for an autism screening

- No big smiles or other joyful expressions by 6 months.\(^b\)
- No back-and-forth sharing of sounds, smiles, or facial expressions by 9 months.\(^b\)
- No back-and-forth gestures, such as pointing, showing, reaching or waving bye-bye by 12 months.\(^a,b\)
- No babbling at 12 months.\(^a,b\)
- No single words at 16 months.\(^a,b\)

Sources:

\(^a\)Filipek et al., 1999; \(^b\)Greenspan, 1999; and \(^c\)Ozonoff, 2003.
Case Finding: **Looking** for Warning Signs

**Infants and Preschoolers**

- Absolute indications for an autism screening
  - No 2-word spontaneous (nonecholalic) phrases by 24 months.\(^a, b\)
  - Failure to attend to human voice by 24 months.\(^c\)
  - Failure to look at face and eyes of others by 24 months.\(^c\)
  - Failure to orient to name by 24 months.\(^c\)
  - Failure to demonstrate interest in other children by 24 months.\(^c\)
  - Failure to imitate by 24 months.\(^c\)
  - Any loss of any language or social skill at any age.\(^a, b\)

**Sources:**

\(^a\)Filipek et al., 1999; \(^b\)Greenspan, 1999; and \(^c\)Ozonoff, 2003.
Case Finding: Looking for Warning Signs

**School-Age Children** (preschool through upper grades)

- **Social/Emotional Concerns**
  - Poor at initiating and/or sustaining activities and friendships with peers
  - Play/free-time is more isolated, rigid and/or repetitive, less interactive
  - Atypical interests and behaviors compared to peers
  - Unaware of social conventions or codes of conduct (e.g., seems unaware of how comments or actions could offend others)
  - Excessive anxiety, fears or depression
  - Atypical emotional expression (emotion, such as distress or affection, is significantly more or less than appears appropriate for the situation)

Case Finding: Looking for Warning Signs

- **School-Age Children (preschool through upper grades)**
  - **Communication Concerns**
    - Unusual tone of voice or speech (seems to have an accent or monotone, speech is overly formal)
    - Overly literal interpretation of comments (confused by sarcasm or phrases such as “pull up your socks” or “looks can kill”)
    - Atypical conversations (one-sided, on their focus of interest or on repetitive/unusual topics)
    - Poor nonverbal communication skills (eye contact, gestures, etc.)

Case Finding: Looking for Warning Signs

**School-Age Children** (preschool through upper grades)

- **Behavioral Concerns**
  - Excessive fascination/perseveration with a particular topic, interest or object
  - Unduly upset by changes in routines or expectations
  - Tendency to flap or rock when excited or distressed
  - Unusual sensory responses (reactions to sound, touch, textures, pain tolerance, etc.)
  - History of behavioral concerns (inattention, hyperactivity, aggression, anxiety, selective mute)
  - Poor fine and/or gross motor skills or coordination

Looking for atypical development

Case Finding: Developmental Screening

- Ages and Stages Questionnaire
  - Paul H. Brookes, Publishers
- Child Development Inventories
  - Behavior Science Systems
- Parents’ Evaluations of Developmental Status
  - Ellsworth & Vandermeer Press, Ltd.
Looking for
Case Finding: atypical development

Staff Development
- School psychologist efforts to educate teachers about the risk factors and warning signs of ASD would also be consistent with Child Find regulations [see 17 CCR 52040(b)(7)]. Giving teachers the information they need to look for ASD (such as is presented in this workshop) will facilitate case finding efforts.
Case Finding: Listening to caregivers

- Referring Concerns That Signal the Need for Autism Screening
  - Communication Concerns
    - Does not respond to his/her name
    - Cannot tell me what s/he wants
    - Does not follow directions
    - Appears deaf at times
    - Seems to hear sometimes but not others
    - Does not point or wave bye-bye

Source:
Case Finding: Listening to caregivers

- Referring Concerns That Signal the Need for Autism Screening
  - Social Concerns
    - Does not smile socially
    - Seems to prefer to play alone
    - Is very independent
    - Has poor eye contact
    - Is in his/her own world
    - Tunes us out
    - Is not interested in other children

Source:
Case Finding: Listening to caregivers

Referring Concerns That Signal the Need for Autism Screening

- Behavioral concerns
  - Tantrums
  - Is hyperactive or uncooperative/oppositional
  - Doesn’t know how to play with toys
  - Does the same thing over and over
  - Toe walks

Source:
Case Finding: Listening to caregivers

- Referring Concerns That Signal the Need for Autism Screening

  - **Behavioral concerns (continued)**
    - Has unusual attachments to toys (e.g., always is holding a certain object)
    - Lines things up
    - Is oversensitive to certain textures or sounds
    - Has odd finger and/or body movement patterns

Source:
Case Finding: Questioning caregivers

- Asking about socialization that probe for issues that would signal the need for an autism screening.
  - “Does s/he …” or “Is there …”
    - cuddle like other children?
    - look at you when you are talking or playing?
    - smile in response to a smile from others?
    - engage in reciprocal, back-and-forth play?
    - play simple imitation games, such as pat-a-cake or peek-a-boo?
    - show interest in other children?

Source:
Case Finding: Questioning caregivers

- Asking about communication that probe for issues that would signal the need for an autism screening.
  - “Does s/he …” or “Is there …”
    - point with his/hr finger?
    - gesture? Nod yes and no?
    - direct your attention by holding up objects for you to see?
    - anything odd about his/her speech?
    - show things to people?
    - lead an adult by the hand?
    - give inconsistent response to his/her name? … to commands?
    - use rote, repetitive, or echolalic speech?
    - memorize strings of words or scripts?

Source:
Case Finding: Questioning caregivers

- Asking about behavior that probe for issues that would signal the need for an autism screening.
  - “Does s/he …” or “Is there …”
    - have repetitive, stereotyped, or odd motor behavior?
    - have preoccupations or a narrow range of interests?
    - attend more to parts of objects (e.g., the wheels of a toy car)?
    - have limited or absent pretend play?
    - imitate other people’s actions?
    - play with toys in the same exact way each time?
    - strongly attached to a specific unusual object(s)?

Refer for assessment as indicated
Screening and Referral

- Screening is designed to help determine the need for additional diagnostic assessments.
- Screening should include medical testing, audiological evaluation, and behavioral assessment.
From research suggesting that individuals with ASD have higher blood lead concentrations, and the hypothesis that lead poisoning may contribute to the onset or acceleration of the development of autistic symptoms, lead screening is recommended for all children referred for an autism screening.

Such would be especially critical if there are reports of the student displaying pica and/or those who live in environments with an increased risk for lead exposure.

School psychologists are not expected to conduct this type of testing, however, it is important for them to know about the lead screening’s role in ASD screening.

Source:
To the extent that hearing loss explains autistic-like behaviors, referrals should be made.

To the extent that there are other warning signs of an ASD that are not explained by a hearing loss (i.e., social and behavioral concerns), additional evaluation should take place.

It is important to keep in mind that autism can co-occur with hearing loss.

While a hearing loss would argue against the need for additional ASD evaluations, educators working with the student should continue to be vigilant for indicators of autism and make additional diagnostic referrals as indicated.

School psychologists are not expected to conduct this type of testing, however, it is important for them to know about the audiological assessment’s role in ASD screening.

Source:
Behavioral Screening for ASD

- School psychologists are exceptionally well qualified to conduct the behavioral screening of students suspected to have an ASD.
- Several screening tools are available
- Initially, most of these tools focused on the identification of ASD among infants and preschoolers.
- Recently screening tools useful for the identification of school aged children who have high functioning autism or Asperger’s Disorder have been developed.
Behavioral Screening of Infants and Preschoolers

**CHecklist for Autism in Toddlers (CHAT)**

Behavioral Screening of Infants and Preschoolers

**CHECKlist for Autism in Toddlers (CHAT)**

Behavioral Screening of Infants and Preschoolers

**CHECKlist for Autism in Toddlers (CHAT)**

- Designed to identify risk of autism among 18-month-olds
- Takes 5 to 10 minutes to administer,
- Consists of 9 questions asked of the parent and 5 items that are completed by the screener’s direct observation of the child.
- 5 items are considered to be “key items.” These key items, assess joint attention and pretend play.
- If a child fails all five of these items they are considered to be at high risk for developing autism.
### Checklist for Autism in Toddlers

## Checklist for Autism in Toddlers

**CHAT Section B: general practitioner or health visitor observation**

| i. During the appointment, has the child made eye contact with your? | YES | NO |
| ii. Get child’s attention, then point across the room at an interesting object and say ‘Oh look! There’s a [name of toy]’. Watch child’s face. Does the child look across to see what you are pointing at? | YES | NO* |
| iii. Get the child’s attention, then give child a miniature toy cup and teapot and say ‘Can you make a cup of tea?’ Does the child pretend to pour out tea, drink it, etc.? | YES | NO† |
| iv. Say to the child ‘Where is the light?’, or ‘Show me the light’. Does the child point with his/her index finger at the light? | YES | NO‡ |
| v. Can the child build a tower of bricks? (if so how many?) (No. of bricks:………) | YES | NO |

* To record Yes on this item, ensure the child has not simply looked at your hand, but has actually looked at the object you are pointing at.
† If you can elicit an example of pretending in some other game, score a Yes on this item.
‡ Repeat this with ‘Where’s the teddy?’ or some other unreachable object, if child does not understand the word ‘light’. To record Yes on this item, the child must have looked up at your face around the time of pointing.

### Scoring:
- □ High risk for Autism: Fails A5, A7, Bii, Biii, and Biv
- □ Medium risk for autism group: Fails A7, Biv (but not in maximum risk group)
- □ Low risk for autism group (not in other two risk groups)

6-year follow-up of a community sample screened with the 2 stage CHAT reveals extremely low false positive rate. However, higher functioning (high IQ) children are missed by this screening (Baird et al., 2000, p. 697).
Checklist for Autism in Toddlers

Behavioral Screening of Infants and Preschoolers

- Modified Checklist for Autism in Toddlers (M-CHAT)

Behavioral Screening of Infants and Preschoolers

*Modified Checklist for Autism in Toddlers (M-CHAT)*

- Designed to screen for autism at 24 months of age.
- More sensitive to the broader autism spectrum.
- Uses the 9 items from the original CHAT as its basis.
- Adds 14 additional items (23-item total).
- Unlike the *CHAT*, however, the *M-CHAT* does not require the screener to directly observe the child.
- Makes use of a Yes/No format questionnaire.
- Yes/No answers are converted to pass/fail responses by the screener.
- A child fails the checklist when 2 or more of 6 critical items are failed or when any three items are failed.
Behavioral Screening of Infants and Preschoolers

- Modified Checklist for Autism in Toddlers (M-CHAT)
  - The *M-CHAT* was used to screen 1,293 18- to 30-month-old children. 58 were referred for a diagnostic/developmental evaluation. 39 were diagnosed with an autism spectrum disorder (Robins et al., 2001).
  - Will result in false positives.
  - Data regarding false negative is not currently available, but follow-up research to obtain such is currently underway.
Modified Checklist for Autism in Toddlers (M-CHAT)

Please fill out the following about how your child *usually* is. Please try to answer every question. If the behavior is rare (e.g., you’ve seen it once or twice), please answer as if the child does not do it.

Modified Checklist for Autism in Toddlers

**M-CHAT Scoring Instructions**

A child fails the checklist when 2 or more critical items are failed OR when any three items are failed. Yes/no answers convert to pass/fail responses. Below are listed the failed responses for each item on the M-CHAT. Bold capitalized items are CRITICAL items.

Not all children who fail the checklist will meet criteria for a diagnosis on the autism spectrum. However, children who fail the checklist should be evaluated in more depth by the physician or referred for a developmental evaluation with a specialist.

Modified Checklist for Autism in Toddlers

http://www.firstsigns.org/downloads/m-chat.PDF
Behavioral Screening of Infants and Preschoolers

☑ **Checklist of Autism in Toddlers (CHAT-23)**

CHAT-23

- Combines elements of the *M-CHAT* (the 23 items) and the *CHAT* (Part B’s direct observations) to form a two stage evaluation.
  - Children who’s caregiver ratings on the 23 item questionnaire (Stage 1) are positive for ASD are then screened with the CHAT’s Part B (Stage 2)
- In the *CHAT-23* the “Yes/No” format of the *M-CHAT* is replaced with a graded response format.
- Answering “seldom” or “never” to any two of seven key questions (Items 2, 5, 7, 9, 13, 15, and 23) or any six of all 23 questions was defined as positive for ASD on Part A.
- For Part B, failure (or positive for ASD) was defined as not passing at least two of the first four items (1, 2, 3, and 4).
To study the CHAT-23, 87 children with autism or PDD (group 1), and 68 normally developing children and 80 children with developmental delays other than autism (group 2) were studied.

Results revealed that failing two or more of the seven key items correctly identified 93 percent of the children with autism (group 1), and failing any 6 of all 23 identified 84% of the children in this group.

On Part B failing any two of the first four items correctly identified 74 percent of the children with ASD.
Behavioral Screening of Infants and Preschoolers

- **Pervasive Developmental Disorders Screening Test - II (PDDST-II)**
  - W-19, Early Screening for Autism: The PDDST-II (Saturday, 9:00 to noon)
Behavioral Screening of Infants and Preschoolers

**Pervasive Developmental Disorders Screening Test - II (PDDST-II)**

- Has three stages
  - The *PDDST-II: Stage I* designed to help determine if a given child should be evaluated for an ASD.
- Designed to be completed by parents
- Should take no more than 5 minutes.
- Odd numbered items are the critical questions used for autism screening.
- If three or more of the odd numbered items are checked as being “YES, Usually True,” then the result is considered a positive finding for possible ASD and a diagnostic evaluation indicted.
Behavioral Screening of Infants and Preschoolers

Pervasive Developmental Disorders Screening Test - II (PDDST-II)

- The odd numbered critical questions are ordered by age in order from highest predictive validity.
  - This means the more odd numbered items scored positive, and the more odd numbered items scored positive on the upper half of each section, the more strongly positive the screen.
- Even numbered items significantly differentiate ASD-referred children from those with mild developmental disorders.
  - These items are also are ordered by age in order from highest to lowest predictive validity.

Behavioral Screening of School Age Children

- *Autism Spectrum Screening Questionnaire (ASSQ)*
Behavioral Screening of School Age Children

**Autism Spectrum Screening Questionnaire (ASSQ)**

- The 27 items rated on a 3-point scale.
- Total score range from 0 to 54.
- Items address social interaction, communication, restricted/repetitive behavior, and motor clumsiness and other associated symptoms.
- The initial ASSQ study included 1,401 7- to 16-year-olds.
  - Sample mean was 0.7 (SD 2.6).
  - Asperger mean was 26.2 (SD 10.3).
- A validation study with a clinical group (n = 110) suggests the ASSQ to be “a reliable and valid parent and teacher screening instrument of high-functioning autism spectrum disorders in a clinical setting” (Ehlers, Gillber, & Wing, 1999, p. 139).
Behavioral Screening of School Age Children

**Autism Spectrum Screening Questionnaire (ASSQ)**

- Two separate sets of cutoff scores are suggested.
  - Parents, 13; Teachers, 11: = socially impaired children
    - Low risk of false negatives (especially for milder cases of ASD).
    - High rate of false positives (23% for parents and 42% for teachers).
    - Not unusual for children with other disorders (e.g., disruptive behavior disorders) to obtain ASSQ scores at this level.
    - Used to suggest that a referral for an ASD diagnostic assessment, while not immediately indicated, should not be ruled out.
  - Parents, 19; Teachers, 22: = immediate ASD diagnostic referral.
    - False positive rate for parents and teachers of 10% and 9% respectively.
    - The chances are low that the student who attains this level of ASSQ cutoff scores will not have an ASD.
    - Increases the risk of false negatives.
Autism Spectrum Screening Questionnaire

The High-Functioning Autism Spectrum Screening Questionnaire

Name of Child ___________________________ Date of Birth __________
Name of Rater ___________________________ Date of Rating __________

This child stands out as different from other children of his/her age in the following way:

1. is old-fashioned or precocious [ ] [ ] [ ]
2. is regarded as an “eccentric professor” by the other children [ ] [ ] [ ]
3. lives somewhat in a world of his/her own with restricted idiosyncratic intellectual interests [ ] [ ] [ ]
4. accumulates facts on certain subjects (good rote memory), but does not really understand the meaning [ ] [ ] [ ]
5. has a literal understanding of ambiguous and metaphorical language [ ] [ ] [ ]
6. has a deviant style of communication with a formal, fussy, old-fashioned or “robotlike” language [ ] [ ] [ ]
7. invents idiosyncratic words and expressions [ ] [ ] [ ]
8. has a different voice or speech [ ] [ ] [ ]
9. expresses sounds involuntarily; clears throat, grunts, smacks, cries or screams [ ] [ ] [ ]
10. is surprisingly good at some thing and surprisingly poor at others [ ] [ ] [ ]
11. uses language freely but fails to make adjustment to fit social contexts or the needs of different listeners [ ] [ ] [ ]
12. lacks empathy [ ] [ ] [ ]

Ehlers et al. (1999, pp.139-140)
## Autism Spectrum Screening Questionnaire

13. makes naïve and embarrassing remarks  
14. has a deviant style of gaze  
15. wishes to be sociable but fails to make relationships with peers  
16. can be with other children but only on his/her terms  
17. lacks best friend  
18. lacks commons sense  
19. is poor at games: no idea of cooperating in a team, scores “own goals”  
20. has clumsy, ill coordinated, ungainly, awkward movements or gestures  
21. has involuntary face or body movements  
22. has difficulties in completing simple daily activities because of compulsory repetition of certain actions or thoughts  
23. has special routines: insists on no change  
24. shows idiosyncratic attachment to objects  
25. is bullied by other children  
26. has markedly unusual facial expression  
27. has markedly unusual posture

Ehlers et al. (1999, p. 140)
Behavioral Screening of School Age Children

**Childhood Asperger Syndrome Test (CAST)**

  - A screening for mainstream primary grade (ages 4 through 11 years) children.
  - Has 37 items, with 31 key items contributing to the child’s total score.
  - The 6 control items assess general development.
  - With a total possible score of 31, a cut off score of 15 “NO” responses was found to correctly identify 87.5 (7 out of 8) of the cases of autistic spectrum disorders.
  - Rate of false positives is 36.4%.
  - Rate of false negatives is not available
# Childhood Asperger Syndrome Test

The Childhood Asperger Syndrome Test (CAST) is a tool used to assess the presence of Asperger Syndrome in children. It consists of 16 questions that evaluate various aspects of a child's behavior and social interaction. The answers are indicated with **YES** or **NO**. 

<table>

Childhood Asperger Syndrome Test

http://www.autismresearchcentre.com/instruments/research_instruments.asp
Behavioral Screening of School Age Children

*Australian Scale for Asperger’s Syndrome (A.S.A.S.)*

- Parent/Teacher rating scale
- 24 questions, 1-6 scale
- 10 behavioral characteristics, yes/no
  - If most questions are 2 to 6
  - If a majority of questions are yes
  - Then diagnostic referral is indicated
Australian Scale for Asperger’s Syndrome (ASAS)

Behavioral Screening of School Age Children

- **Social Communication Questionnaire (SCQ)**
Behavioral Screening of School Age Children

Social Communication Questionnaire (SCQ)
Behavioral Screening of School Age Children

**Social Communication Questionnaire (SCQ)**
- Two forms of the *SCQ*: a *Lifetime* and a *Current* form.
  - *Current* ask questions about the child’s behavior in the past 3-months, and is suggested to provide data helpful in understanding a child’s “everyday living experiences and evaluating treatment and educational plans.”
  - *Lifetime* ask questions about the child’s entire developmental history and provides data useful in determining if there is need for a diagnostic assessment.
- Consists of 40 Yes/No questions asked of the parent.
- The first item of this questionnaire documents the child’s ability to speak and is used to determine which items will be used in calculating the total score.
Behavioral Screening of School Age Children

- **Social Communication Questionnaire (SCQ)**
  - An “AutoScore” protocol converts the parents’ Yes/No responses to scores of 1 or 0.
  - The mean SCQ score of children with autism was 24.2, whereas the general population mean was 5.2.
  - The threshold reflecting the need for diagnostic assessment is 15.
  - A slightly lower threshold might be appropriate if other risk factors (e.g., the child being screened is the sibling of a person with ASD) are present.
Behavioral Screening of School Age Children

**Social Communication Questionnaire (SCQ)**

- While it is not particularly effective at distinguishing among the various ASDs, it has been found to have good discriminative validity between autism and other disorders including non-autistic mild or moderate mental retardation.

- The *SCQ* authors acknowledge that more data is needed to determine the frequency of false negatives (Rutter et al., 2003).

- This *SCQ* is available from Western Psychological Services.
