SAS DATASET DOCUMENTATION AND TECHNICAL REPORT**

INTRODUCTION

The Behavioral Risk Factor Surveillance System

The Behavioral Risk Factor Surveillance System (BRFSS) is an on-going telephone survey of randomly selected adults, which collects information on a wide variety of health-related behaviors. The BRFSS has been conducted since 1984 by the California Department of Public Health (CDPH) in collaboration with the Centers for Disease Control and Prevention (CDC). Data collection was conducted by Public Health Institute (PHI) through 2013, and in 2014 the Population Research Center (PRC), formerly known as the Public Health Survey Research Program (PHSRP), at California State University, Sacramento (Sacramento State) assumed responsibility for data collection. This documentation is designed to facilitate use of this database by public health researchers.

Part I is a technical report summarizing BRFSS interview procedures, sample and respondent selection, and questionnaire design. It also provides response rates and an evaluation of the representativeness of the sample. Parts II -V include a data dictionary, coding for categorical and numeric variables, and a cross-reference of variable name and subject. Parts VI and VII provide information on calculated variables, including weights. Unweighted one-way frequencies of all categorical variables and survey instruments are available by request.

A few critical features of BRFSS and the dataset should be kept in mind:

- Beginning in 2014, we are providing the CDC weights for the CA BRFSS data to be consistent with information provided by other states and nationally. As a result there are 2 groups of weights: (1) the CA weights, and (2) the CDC weights (see Part VI: Weights).
  - In addition to the information provided here about CDC weights, the CDC provides a great deal of information about BRFSS data including a codebook, calculated variable data files, data quality reports, weighting formulas, and SAS resources on the CDC BRFSS website.[1]

- Several changes to sampling and weighting methodology occurred in 2012 resulting in 2 year ranges within, but not between, which trend analyses may be conducted with each set of weights provided: 1) for CDC weights 1984 – 2010 and 2011 – present, and 2) for CA weights1984 – 2011 and 2012 – present (see Sample and Respondent Selection Sections in Part I: BRFSS Technical Report and Part VI: Weights).

- Beginning in 2014, core BRFSS interviews conducted by other states with California residents who have cell phone numbers with area codes originating from other states are now included in the dataset and used in weighting (see Part I: BRFSS Technical Report).
  - When conducting analysis with the CA created weights, be aware that these additional cases were utilized in creating the CA weights beginning in 2014.
  - These cases are missing values in CA specific questions about Asian subcategories, education, and income, but not in the CDC versions of these

---

[1] www.cdc.gov/brfss/annual_data/annual_data.htm. Documentation available for each year of data collection.

variables (see PART II: SAS Dataset Data Dictionary for further details).

- Prior to 2014, CA did not collect interviews where individuals refused to respond or responded with "don't know" to variables used to create the CA weights (i.e., age, sex, and race). Beginning in 2014, interviews for these respondents continued as CDC imputes these data to create weights. CA does not use imputed data when creating the CA weights and so do not have data in those weight variables.

- Although the SAS labels shown in the data dictionary provide some information on the content of the variable, they are, of necessity, an abbreviated version of the question. It is highly recommended that the actual question and response categories be carefully reviewed before analyzing data. Survey instruments are available on the PRC website (https://www.csus.edu/center/population-research-center/california-behavior-risk-factor-surveillance-system.html).

- Not every question listed in the data dictionary was asked each year. Parts II and V list all variables and the years during which the question was included on the survey.

- Questions that were on the survey for more than one year may not have appeared in the same order on the survey and may have undergone slight wording modifications. When it was felt that changes in wording or response categories were likely to cause non-comparability of data, variable names were changed. However, it is highly recommended that the actual wording for each year be reviewed and assessed individually.

- Not every question is asked of all participants. Some questions are skipped during the interview because of answers to previous questions or because of age or sex criteria. In general, skipped questions are set to missing, thus restricting the denominator for the rate based on that question. For example, only people who state that they have ever smoked (SMOKE100=1) are asked if the now smoke every day, some days or not at all (SMKEVDA2). Therefore, the frequency of SMKEVDA2=1 (yes) is the proportion of ever smokers who currently smoke every day. To calculate the proportion of the population who currently smoke every day, a new variable must be created which combines information from SMOKE100 and SMKEVDA2. Many such calculated variables have already been created to facilitate use of the database, and are listed in Part VII of the documentation. These variable names generally start with an underscore (e.g., _RFSMOKE).

- Some, but not all, continuous variables have special values (i.e., 999=refused). These values may need to be recoded (e.g., set to missing) prior to analysis to obtain meaningful results. Such variables are indicated on the data dictionary in Part II and a list of codes given in Part III.

- As discussed in the technical report in Part I, the age, race and sex distribution of the sample does not completely match that of the adult California population. To adjust for this and to equalize the probability of being drawn into the sample, weights have been created. The creation and use of these weights are discussed in Part VI. It is important to use these weights to obtain meaningful prevalence estimates for the California population and to assess changes in behavior while controlling for changes in the demographics of the California population.

- The number of interviews conducted each year has varied by nearly fourfold. In 2012, the annual weights have been calculated to sum to the total 2010 California population, thus adjusting for the changes in sample size. To calculate meaningful estimates based on data aggregated over two or more years, the data should be appropriately reweighted.

- Because of the survey design, special programs and/or procedures for survey data analysis should be used in analyses. Weights and stratification variables are available on the dataset and should be used in analyses. Specialized programs such as SUDAAN, or survey-specific procedures in programs such as SAS, Stata, SPSS, and R allow incorporation of survey design variables into analyses, such as weights and stratification variables, and must be used to accurately calculate standard errors and tests of statistical significance.

- The public use datasets does not contain any personal identifiers such as name, phone number, address, zip code, or social security number. Unique records can be identified using the variables SEQNO and SEQNOQ (depending on the year).

- Although every effort has been made to accurately document the database, it is possible that the database contains some coding errors or inconsistencies. A prudent approach would be to first run a simple frequency on any question you intend to use in your analyses to check for out of range values, special codes, or unexpected skip patterns. We would be grateful for having any such problems brought to our immediate attention.

Any publications based on these data should acknowledge the CDPH, PRC, and the CDC, as indicated in the acknowledgment section of this document.

Population Research Center

The Population Research Center (PRC; formerly the Public Health Survey Research Program; https://www.csus.edu/center/population-research-center/) was created in 2014 to align the research needs of the CDPH with the dynamic faculty and student capacities of Sacramento State. Housed in Sacramento State's Folsom Hall, the allied health hub of the campus, PRC is a collaboration of CDPH, Academic Affairs, and the Colleges of Health and Human Services and Social Sciences and Interdisciplinary Studies. PRC conducts research which increases our understanding of people's health behaviors and their health needs, and provides policy makers with the data they require to make evidence-based decisions.

Questions concerning this documentation or PRC can be addressed to:

Part I: BRFSS TECHNICAL REPORT

Sample and Methods

The California BRFSS is an ongoing effort by the CDPH in conjunction with the CDC to assess the prevalence of and trends in health-related behaviors in the California population aged 18 years and older. Data are collected monthly from a random sample of California adults living in households with telephones. The BRFSS database contains information on California residents from 1984 through the present.

Questionnaire design

The BRFSS questionnaire is developed each year by CDC in collaboration with participating state agencies. Wherever possible, questions have been selected from previously conducted national surveys for comparability. The questionnaire has three components. The first component consists of a core set of questions that are administered by all states participating in the BRFSS collection effort. Many of the core questions have remained fixed from year to year, although revisions are made to the core annually. Changes are implemented at the beginning of each interviewing year. Revisions to the core over the years have included modifications in question wording, inclusion of new questions or exclusion of previously asked questions, changes in skip patterns, and changes in the order in which questions were asked. Some changes have been relatively minor, such as changes in the wording of introductory statements. Starting in 1992 CDC implemented a "rotating core" strategy, allowing some core questions to appear on the questionnaire in alternate years only. The second component of the questionnaire consists of a series of topical modules developed by the CDC. States have the option of adding as many modules as they wish to the core questionnaire each year. California has used several of the CDC modules, although the same modules have not been used consistently across all years of the survey.

The final component of the questionnaire consists of questions designed and administered by individual states to address issues of local concern. These have been revised annually in California to address the needs of as many programs as possible. Because all three components of the questionnaire have been modified since the first survey in 1984, questions should be reviewed carefully by researchers before undertaking analyses of these data.

Participants in the California BRFSS are asked about a wide variety of behaviors such as seat belt use, exercise, weight control, diet, tobacco and alcohol consumption, utilization of cancer screening procedures and other preventive measures. They also are asked for basic demographic information such as age, race/ethnicity, marital and employment status, household income and education. Participation in the BRFSS is completely voluntary and anonymous. The time constraints of a telephone interview have limited the number of questions that can be placed on the survey in any one year. In addition, there are skip patterns within the instrument, based on the sex, age and reported behaviors of the participant (e.g., smoking), so that in some cases a completed interview may consist of fewer than one hundred questions.

Interview procedures

Interviews are conducted by trained interviewers following standardized procedures developed by CDC. In general, interviews are conducted during weekday, evenings and on weekends throughout the calendar year (month of interview is available as a variable in the datasets, See Part II: SAS Dataset Data Dictionary), although some interviews are conducted during weekday business hours. Interviewers recorded responses with paper and pencil until May 1985, when the

Computer-Assisted Telephone Interview (CATI) system was fully implemented. Using the CATI system, interviewers read questions as they are displayed on a computer screen. Responses are keyed directly into the computer. Automatic data editing and coding programs prevent invalid responses from being entered and greatly increase the accuracy and speed of data entry. In addition, the interview process is facilitated by automatically skipping questions based on prior responses, so that, for example, men are not asked questions about Pap tests.

There are several years during which data collection timeframes were significantly different than in other years. In 2014 there was a change in data collection contactor and so data was collected from July 2014 through January 2015. In 2020, the COVID-19 panademic resulted in the closure of the PRC call center for several weeks at a time throughout the year, resulting in breaks between completed interviews, and a reduced number of interviews collected.

Sample selection

BRFSS sample is currently provided to California by the CDC which determines and conducts the sampling methodology, and the CDC provides information about the sample design on their BRFSS website each year.[2] The BRFSS uses a dual-frame sampling design, with both cell and landline random-digit dial components. Prior to 2012, the BRFSS included only a landline random-digit dial component. Survey design variables provide information about sample selection methods and should be incorporated into design-based analyses using CA BRFSS data; see Part VI: Weights for more information. Some sampling selection methods of previous years are discussed below.

From 1984 through 1993, BRFSS participants were selected using the Waksberg method[3], a multi-stage cluster sampling technique designed to generate a random sample of all California households with telephones. Prior to beginning data collection each year, the CDC provided California with a sampling frame of several thousand 10-digit telephone numbers. This frame was drawn from the universe of all 10-digit telephone numbers beginning with a valid 6 digit area code-prefix combination. Telephone numbers with area codes and prefixes from heavily populated areas of the state appeared more frequently in the sampling frame than those from sparsely populated areas, so that the probability of selecting any number was proportionate to the relative size of the population of the geographic region in which that number was found.

Seven to ten days before the start of each interviewing month, several hundred telephone numbers were selected at random from the sampling frame. These numbers received screening telephone calls, during which an interviewer confirmed that the number reached corresponded to the number listed in the frame, and asked if the number was located in a residence. All non-residential numbers were eliminated from the sampling frame. Numbers also were eliminated if no disposition could be obtained for them after four different attempts were made to obtain an answer at the number.

Primary sampling units (PSUs) were created from the first 8 digits of each of the screened residential telephone numbers, so that each PSU consisted of a block of 100 10-digit telephone numbers (xxx-yyy-aabb=standard 10 digit telephone number; xxx=area code, yyy=prefix, aabb=4 digit suffix; xxx-yyy-aa00 through xxx-yyy-aa99=PSU). Within each PSU, the telephone number

---

[3] Waksberg, J.S. Sampling methods for random digit dialing. J Am Stat Assoc. 1978; 73:40-46.

originally used to contact a household for screening purposes became the first number to be called. Thereafter, a random two-digit number was selected without replacement from the remaining available numbers in the PSU. This two-digit number was appended to the eight-digit PSU number for a complete telephone number to contact. This replacement process continued until three completed interviews were obtained or all possible numbers in the PSU were exhausted.

During 1992, a methodological study was undertaken to compare the characteristics of the random digit dial (RDD) sample described above with a screened RDD sample purchased from a commercial sampling firm. Prior to testing for differences between samples, the variance estimates calculated for the Waksberg sample were corrected to adjust for the design effect introduced thorough the multi-stage cluster sample. Demographic and behavioral characteristics were compared to determine if bias was introduced in the process of selecting and screening the purchased sample. It was determined that the screening process used in developing the purchased sample did not produce a biased sample of adult Californians living in households with telephones. The screened RDD sample also was more cost-effective and efficient than samples generated by the Waksberg method. Additionally, when using samples derived from a screened RDD, standard statistical packages can be used to calculate variance and other sample statistics.

California began using a screened RDD sample purchased from a commercial sampling firm for the 1994 BRFSS, and has continued to use this method in BRFSS from 1994 through present. The current firm is Marketing Systems Group (MSG) which CDC uses to provide California with the sample.

Respondent selection

Prior to 2012, only persons living in households were eligible to participate in the survey. Beginning in 2012 and beyond, persons living in either households or college housing were eligible to participate, and survey screener questions were updated. If a potential respondent indicated he or she did not live in a household, a follow-up question was asked to determine if he or she lived in college housing. If the person lived in college housing, the person who answered the phone was considered the selected respondent. Other than this change, the respondent selection methods for those living in households have been similar from 1984 to present.

In the landline sample, once a household is reached, all persons living in the household aged 18 years or older are eligible to participate in the survey. If more than one member of the household is eligible, one person is selected at random (using a computer-generated random selection algorithm based on the number of adults in the household and the last digit of time of the interview) to become the respondent. If the person selected is not available, an appointment is made to conduct the interview at a different time or on another day. Once a respondent is selected no other household member can be selected, even if it is not possible to obtain an interview from the selected respondent.

The 2013 BRFSS included a cell phone random-digit dial frame. For the cell phone sample, respondent selection was conducted differently compared to the landline sample. In the cell phone sample, the selected respondent was always the respondent who answered the cell phone and self-identified as the primary user of the cell phone.

In order to maximize the representativeness of the sample, standardized procedures are followed for calling back numbers which ring with no answer or give a busy signal, or for encouraging selected respondents who are reluctant to participate. Each time a number is called, a record is

kept of the outcome of the phone call. Numbers are not called back only when it is determined that: 1) a telephone number is non-working or assigned to a business; 2) there is no eligible respondent in the household, or; 3) the selected respondent is unavailable during the time period of the survey, is unable to complete the interview due to a language barrier (surveys are currently conducted in English and Spanish), or has some impairment that prevents him or her from communicating over the telephone.

Respondents who refuse to participate are not eliminated immediately; in an effort to persuade them to cooperate, they receive a second call after a 2 to 5 day "cooling off" period. If a second refusal comes from a household member other than the respondent, or if the interviewer or supervisor believes that the respondent might change his or her mind after a second refusal, a third call is made to the household a day or two after the second refusal. A number is eliminated if this third call results in a refusal. Telephones that ring with no answer, give a busy signal, or are picked up by an answering machine are eliminated after 10-15 attempts, for landline numbers, and 6-8 attempts, for cell phone numbers, to reach them, with at least one call each during a day, evening, and weekend shift.

Through 2013, respondents who did not provide their sex, age, and race/ethnicity were not allowed to continue with the survey and were, therefore, not included in the final dataset. Responses for sex, age, and race/ethnicity are required to calculate survey weights.

Weighting Procedures

As discussed below in "Representativeness of the Sample", the age, race, and sex characteristics of the BRFSS sample differ to some extent from the age, race, and sex characteristics of the California population. Weighting adjustments are used to compensate for this discrepancy. Prior to performing analyses on the BRFSS data, the sample should always be weighted so that its age, race, and sex composition corresponds to that of the California population. Weights that adjust for age, race, and sex have been calculated for all years for the BRFSS sample, and are discussed in Part VI: Weights.

Response rates

Response rates measure how successful a survey has been in reaching selected respondents. Two rates are calculated for the BRFSS, an "upper-bound" rate and a CASRO (Council of American Survey Research Organizations) rate. Since 2002, response rates are produced according to the American Association of Public Opinion Research (AAPOR) guidelines.

In 2013, calling protocols were revised using the revised protocol from CDC. Due to this change, response rates in 2013 are markedly higher, as compared to 2012. Historically, changes in response rates have been observed before due to protocol changes. For example, during the 1998 survey year, it was decided that refusals should be accepted only from adult household members in enumerated households. Implementing this revised policy resulted in an increase in response rates. During the 2000 survey, it was decided to revert to the original policy, therefore the response rates were lower. In addition, CDC revised the protocol for assigning disposition codes in 2001 and again in 2012, which led to changes in the response rate formulas and resulting changes in response rates.

The upper-bound cooperation response rate presented is based on AAPOR formula 4. Additional AAPOR response rates are available on request. The upper-bound response rate indicates the proportion of eligible households contacted which resulted in a completed interview.

Part I: BRFSS Technical Report

Year	Upper Bound	Year	Upper Bound	Year	Upper Bound	Year	Upper Bound
1987	77%	1996	66%	2005	66%	2014	54%
1988	80%	1997	65%	2006	65%	2015	70%
1989	83%	1998	75%	2007	59%	2016	77%
1990	82%	1999	82%	2008	57%	2017	82%
1991	81%	2000	66%	2009	59%	2018	73%
1992	84%	2001	72%	2010	59%	2019	73%
1993	79%	2002	71%	2011	58%	2020	72%
1994	76%	2003	69%	2012	53%		
1995	70%	2004	70%	2013	77%		

The CASRO response rate is based on AAPOR formula 4, and assumes that some numbers that could not be reached represent eligible households. The CASRO rate for the California BRFSS has varied since 1987, when the CDC began CASRO rate calculations.

Year	CASRO	Year	CASRO	Year	CASRO	Year	CASRO
1987	43%	1996	47%	2005	38%	2014	27%
1988	57%	1997	48%	2006	37%	2015	39%
1989	64%	1998	53%	2007	35%	2016	37%
1990	62%	1999	58%	2008	34%	2017	44%
1991	60%	2000	47%	2009	43%	2018	43%
1992	62%	2001	28%	2010	41%	2019	45%
1993	64%	2002	43%	2011	36%	2020	42%
1994	58%	2003	39%	2012	29%		
1995	52%	2004	39%	2013	42%		

The Dataset

Each year a dataset is created containing information from all the BRFSS interviews collected during that calendar year. Each quarter, before the data are added to the annual database, they are checked extensively for possible errors. Any suspicious or out-of-range values are compared to the respondent's original answers. The sample size for each year is presented below.

Year	Sample size	Year	Sample size	Year	Sample size	Year	Sample size
1984	1,086	1993	3,610	2004	4,663	2014	8,832
1985	1,369	1994	3,999	2005	6,098	2015	12,601
1986	1,569	1995	4,046	2006	5,692	2016	11,393
1987	1,784	1996	4,003	2007	5,718	2017	9,357
1988	2,462	1997	4,063	2008	11,640	2018	11,919
1989	2,398	1998	4,045	2009	17,539	2019	11,613
1990	2,701	1999	4,149	2010	17,955	2020	4,798
1991	2,995	2000	4,017	2011	17,525		
1992	3,982	2001	4,188	2012	14,043		
2002	4,388	2003	4,439	2013	11,214		

Prior to 2014, PHI produced the dataset using only the interviews they conducted with California residents, but did not include cell phone data provided to by the CDC of respondents with non-

California cell phone number, but living in California. Starting in 2014, PRC is including this data in the datasets and in the sample size numbers listed above. Interviews conducted with cell phone respondents with a California cell phone number but residing in other states are not included; those data were provided to the CDC for distribution to the states of residence.

Table I shows the distribution of the cumulative sample by age, race, and sex before weighting. In Table 1 and in the remainder of this report, "White" refers to non-Hispanic Whites, "Hispanic" refers to those persons who indicated that they were of Hispanic or Latino origin regardless of race, "Black" refers to those persons who stated that their race was non-Hispanic African American or Black, and the categories "Asian/Other" refer to non-Hispanic Asian, non-Hispanic Pacific Islander, non-Hispanic American Indian, non-Hispanic Alaska Native, and other racial/ethnic groups combined.

Table I: *Sample by Age, Race, and Sex (Cumulative 1984-2020)*

| Sex | Race/Ethnicity* | Age* Categories | | | | | | | Total |
		18-24	25-34	35-44	45-54	55-64	65+	Refused	
Male	White	4,009	7,932	9,772	11,387	12,372	18,355	155	63,982
	Black	461	797	888	960	954	924	16	4,984
	Hispanic	3,834	6,381	6,335	4,914	3,341	2,619	49	27,424
	Other	1,431	2,403	2,320	1,755	1,353	1,259	55	10,521
	Refused*	26	71	62	40	57	68	64	324
	Male Subtotal	9,761	17,587	19,377	19,056	18,077	23,225	339	107,235
Female	White	3,807	9,050	12,119	14,550	16,695	28,984	149	85,354
	Black	620	1,324	1,393	1,346	1,291	1,505	15	7,494
	Hispanic	3,798	8,661	8,708	6,187	4,270	4,205	52	35,881
	Other	1,216	2,307	2,413	1,895	1,526	1,578	59	10,994
	Refused*	9	38	38	36	41	71	36	269
	Female Subtotal	9,450	21,380	24,671	24,014	23,823	36,343	311	139,992
Total		19,211	38,967	44,048	43,070	41,900	59,568	650	247,227

*Beginning in 2014, respondents were allowed to participate in the survey when answering "don't know" or "refused" to race/ethnicity and age and in 2017 they could answer "don't know" or refuse the sex question.

Representativeness of the Sample

Through the sampling process described above, California attempts to collect interviews from a random sample that is representative of the population of the state. In an effort to assess the degree to which the composition of the sample matches the actual demographic composition of the state, the sample has been compared to the 2010 Current Population Survey for California (CPS) or to data from the Department of Finance (DOF) population estimates on several important variables. These include race and ethnicity, sex, educational level, household income, and age.

Figure 1 compares the racial/ethnic distribution of the 2020 unweighted BRFSS sample with the California population estimated racial/ethnic group distribution in the 2010 Census Summary Tables. The number of interviews with each race approximates the 2010 census numbers with minor deviations for blacks. Whites are overrepresented by 7% with Hispanics and Asians/other being underrepresented by 4.9% and 3.2%.

Figure 1: Distribution of Race/Ethnicity
2020 BRFSS Sample vs. 2010 California Population[4]
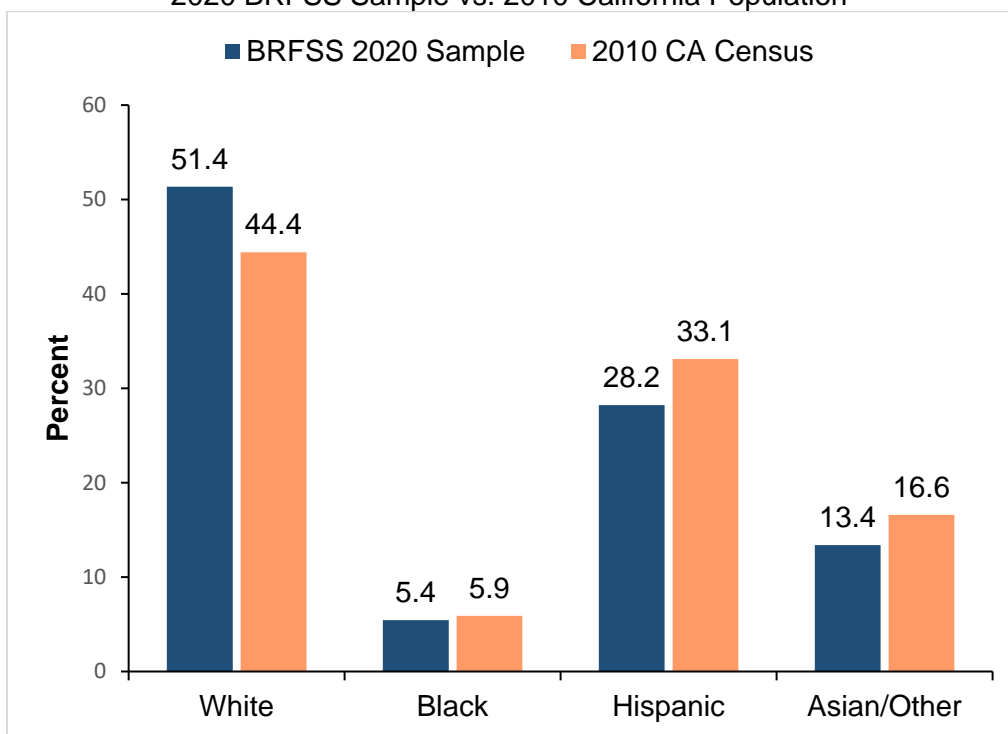

Table II and Figure 2 compare the sex-specific racial/ethnic distribution of the 2020 unweighted BRFSS sample with the distribution of the 2010 California population. The expected number of interviews in Table II is calculated by multiplying the actual number of interviews conducted within a given racial/ethnic group by the race-specific sex distribution in the California population. Figure 2 presents the percent difference between observed and expected sample size by race and sex. Females are over-represented slightly by 0.9% with males under-represented by 1%. Looking at sex representation broken down by race, sex is best represented in Hispanics with only a 0.6% deviation from expectations given population estimates. White females are slightly over-represented by 4.5% with white males being underrepresented by a similar amount. Asian/Other males are significantly over-represented by 14.1% with Asian/other females being underrepresented by 12.9. Last, sex is worst represented in blacks with black females being over-represented by 22.2% with black males being underrepresented by 23.2.

[4] State of California, Department of Finance, California State Center, Census 2010 Summary File 1, Adults ages 18 and older.

Table II: *Sex and Race Distribution of 2020 BRFSS Sample Compared to 2010 CA Population Estimate*

Race/Ethnicity*	Sex	BRFSS 2020 Sample		CA 2010Estimates	Expected	Net Difference	Proportional Difference
Total	Male	48.7%	2,338	49.2%	2,361	-23	-1.0%
	Female	51.3%	2,460	50.8%	2,437	23	0.9%
White	Male	47.1%	1,161	49.4%	1,217	-56	-4.6%
	Female	52.9%	1,303	50.6%	1,247	56	4.5%
Black	Male	37.6%	98	48.9%	128	-30	-23.2%
	Female	62.4%	163	51.1%	133	30	22.2%
Hispanic	Male	50.6%	685	50.3%	681	4	0.6%
	Female	49.4%	669	49.7%	673	-4	-0.6%
Asian/Other	Male	57.1%	350	47.8%	307	43	14.1%
	Female	42.9%	292	52.2%	335	-43	-12.9%

*Calculations for this table do not include respondents who refused the race/ethnicity.

Figure 2: Expected Sample Size Difference by Gender
2020 BRFSS Sample vs. 2010 California Population[5]
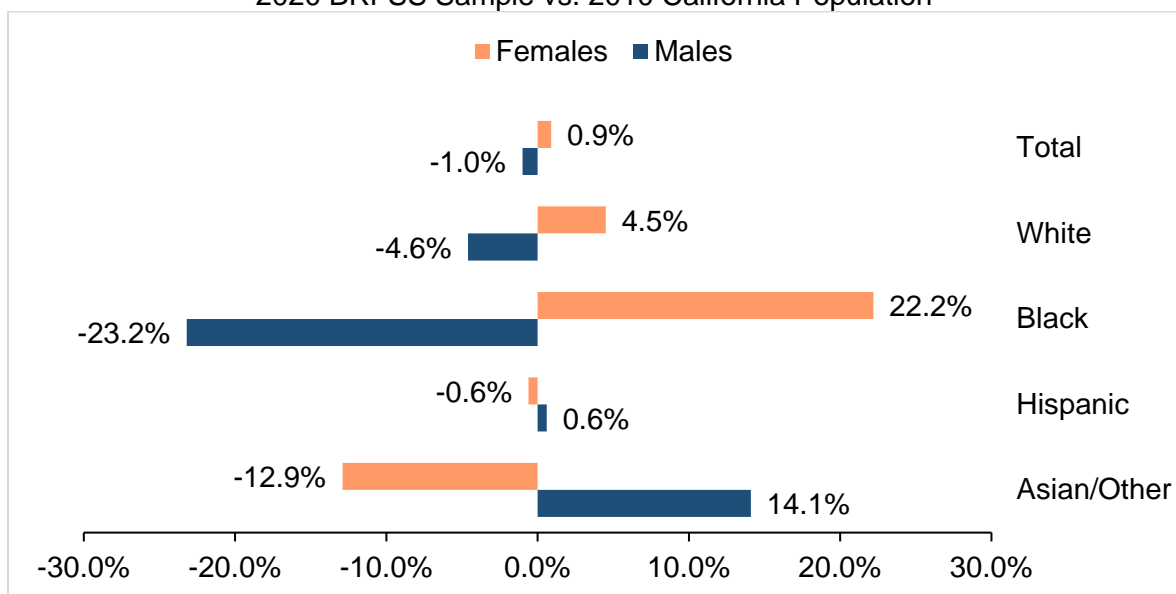

Table III shows the distribution of educational level among adults aged 25 and older, comparing the current BRFSS sample (unweighted) to data from the 2010-2011 California Current Population Survey (CPS). Comparisons of the BRFSS should be interpreted with caution, since the CPS is weighted to national estimates of age, gender, race, Hispanic origin, and family equalization[6]. Comparisons of educational level should also be interpreted with caution, due to wording differences in the categories.

---

[5] State of California, Department of Finance, California State Center, Census 2010 Summary File 1, Adults ages 18 and older.

[6] The family equalization procedure categorized adults into seven groups based on sex and household composition. See "Technical Paper 63RV: Current Population Survey – Design and Methodology," issued March 2002, page 99.

Table III: *Education Level among Adults (Age 25+) in 2020 BRFSS vs. 2010-2011 CA Current Population Survey*

| | Race/Ethnicity | | | | | | | | | |
| | White | | Black | | Hispanic | | Other* | | Don't Know/ Refused** | |
Education	BRFSS	CPS	BRFSS	CPS	BRFSS	CPS	BRFSS	CPS	BRFSS	CPS
Not a HS Grad	1.2%	5.0%	5.5%	9.2%	33.5%	40.5%	1.1%	10.5%	0.0%	--

Some College	21.0%	31.3%	29.4%	36.5%	19.4%	20.0%	12.4%	22.2%	20.8%	--
College Grad	21.5%	26.5%	21.0%	19.2%	12.2%	8.6%	25.8%	33.9%	30.2%	--
Post Grad	19.8%	16.0%	13.0%	7.9%	6.1%	2.9%	23.5%	14.4%	13.2%	--
Missing***	25.9%	--	20.2%	--	9.4%	--	28.1%	--	32.1%	--
Total	100%	100%	100%	100%	100%	100%	100%	100%	100%	--

*CPS category includes only Asian and Pacific Islander. Other category estimated from CPS totals.

**Beginning in 2014, respondents were allowed to participate in the survey when answering "don't know" or "refused" to race/ethnicity.

***Education is missing because out of state resident CA cell phone respondents (included in 2014 for the first time) do not answer the CA education question.

Figure 3 compares the 2020 BRFSS sample (unweighted) to the CPS data only for those persons aged 25 or older who have had some college education, obtained a college degree, or obtained an advanced degree. As this figure shows, the BRFSS sample has a larger proportion of more highly educated persons across all racial/ethnic groups than would be expected given their proportions in the population. The discrepancy is proportionally greatest among Blacks.

Figure 3: Percent of Adults (Age 25+) with at Least Some College Education
2010 BRFSS Sample vs. 2010-2011 CA Current Population Survey[7]
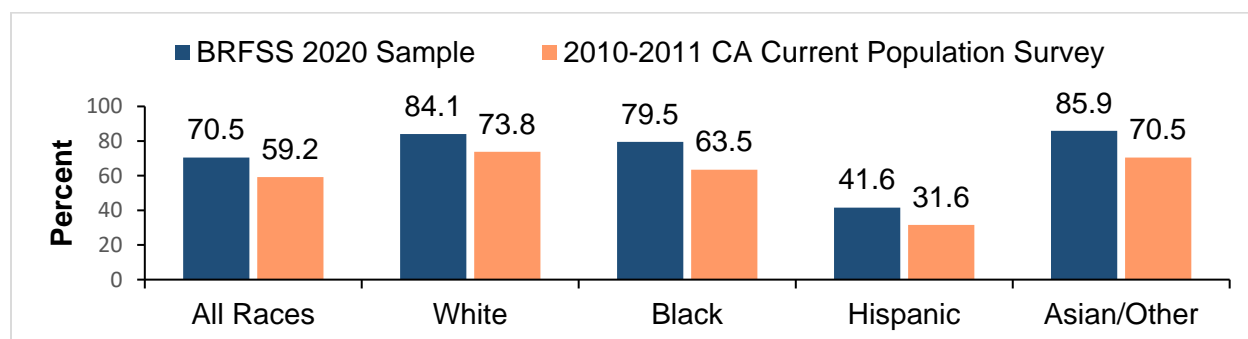

Analyses comparing the 2020 BRFSS annual income distribution to population-based income distributions are difficult because approximately 10 percent of the BRFSS respondents declined to provide their household income. Figure 4 compares the household income distribution of the unweighted BRFSS sample to the 2010-2011 CPS (reporting 2010 household income), excluding those who said they did not know their household income or who refused to answer the question. Income data was aggregated to reflect the CPS income categories available. Those making less than $20,000 comprised 22.1% of the sample but only 17% of the population, while those making

---

[7] 2010-2011 CA Current Population Survey (2010 reported education and income).

between $20,000 and $50,000 comprised 18.5% of the sample but 28.4% of the population. Last, those making less than $75,000 comprised 13.1% of the sample but 17.7% of the population while those making more than $75,000 comprised 46.3% of the sample but only 36.9% of the population.

Figure 4: Distribution of Household Income

2020 BRFSS Sample vs. 2010-2011 CA Current Population Survey[7]
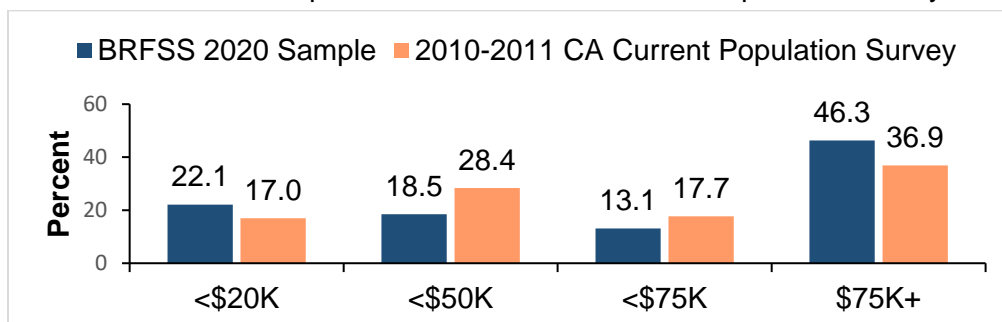

Figures 5 and 6 compare the age distribution of the unweighted 2020 BRFSS sample to the 2010 California population for men and women. The younger age groups below age 49 are unrepresented in both males and females, particularly 18-34-year-old females (25.0% vs. 34.5%). Additionally, both men and women aged 65 and older are the most over-represented, again particular among women 29.5% vs. 13.4%).

Figure 5: Distribution of Age for Males

2020 BRFSS Sample vs. 2010 California Population[8]
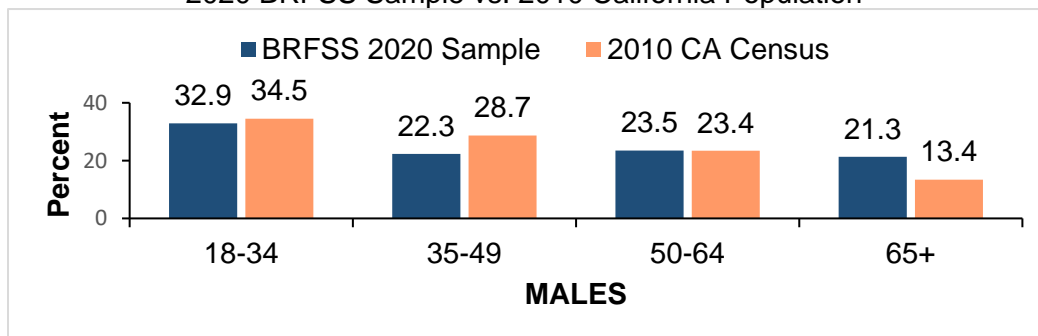

Figure 6: Distribution of Age for Females

2020 BRFSS Sample vs. 2010 California Population[8]

PART II: SAS DATASET DATA DICTIONARY

The cumulative BRFSS datasets, which were collected from 1984 – 2020, contain data from interviews with 219,279 randomly selected California adults. The number of interviews conducted varies each year and the survey instrument was modified annually. Information on the years during which specific variables are available is provided in the table, including raw, calculated, and weight variables. Variables listed below with **are suppressed from public use dataset to preserve confidentiality, and those listed with ***are suppressed from public use dataset for counties with less than 100,000 population to preserve confidentiality.

In addition to the years each variable is available, the raw variable and calculated tables below also contain response format. The format for continuous variables which contain special values (e.g., 99=REFUSED) are identified with roman numerals, which are explained in Part III: Coding for Continuous Variables. Other formats referenced below (e.g., OFTENC.) are explained in Part IV: Categorical Variable Formats. Variables with no specified format are either character strings or numeric with no special values; i.e., all missing values are coded as '.' on the SAS dataset.

Variables listed by subject group (e.g., Access to Health Care), are found in Part V: Index to Variable Names by Subject. Additional information on weight variables and calculated variables are found in Part VI: Weights and Part VII: Calculated Variables and should be consulted prior

[11] Beginning in 2014, core BRFSS interviews conducted by other states with California residents who have cell phone numbers with area codes originating from other states are now included in the dataset. The CA version of child race has more answer categories for Asian subgroups than the CDC version. Respondents with data collected by other states answered the CDC version of child race (RCSRACE1) not the state versions (CH_RA2AB, CH_RA2AB_1 thru CH_RA2AB_19). Therefore, they are missing values in the state Asian subgroups questions, but have values in RCSRACE1.

---

[12] Beginning in 2014, core BRFSS interviews conducted by other states with California residents who have cell phone numbers with area codes originating from other states are now included in the dataset. The CA version of education (EDUCA) has more answer categories than the CDC version (EDUCAC). Respondents with data collected by other states answered the CDC version of education (EDUCAC) not the state version (EDUCA). Therefore, they are missing values in EDUCA, but have values in EDUCAC.

FLUSH_G	NUM	YESNO.	2001	FLU SHORTAGE – FAMILY/FRIENDS
FLUSH_H	NUM	YESNO.	2001	FLU SHORTAGE – OTHER
FLUSHOT	NUM	YESNO.	1987, 1991 1993, 1995-1997, 1999-2004	HAD FLU SHOT PAST 12 MONTHS
FLUSHOT2	NUM	YESNO.		FLU SHOT IN PAST YEAR
FLUSHOT3	NUM	YESNO.	2005-2009	HAD FLU SHOT IN PAST 12 MONTHS
FLUSHOT4	NUM	YESNO.	2009-2010	HAD SEASONAL FLU SHOT IN PAST 12 MONTHS

---

[13] In 2008, FLUPLAC4 should have been renamed as there was a change in answer format, however it was not and there now exists 2 FLUPLAC4 variables. If conducting a multi-year analysis with both of these variables, investigators should change the name of one of these variables before merging the datasets.

VARIABLE	TYPE	FORMAT	YEAR	LABEL
FLUSHOT5	NUM	YESNO.	2011-2013	HAD SEASONAL FLU SHOT OR SPRAY IN PAST12 MONTHS

---

[14] Discrepancy discovered in 2016 codebook review - HIV_BUY, HIV_HOW, HV_KIT, HIV_RSLT, HIV_TEST, and HIV_WHR are listed in the codebook and the questionnaire for 1999 (but no sponsor for the questions are listed), however the 1999 dataset is missing these variables. It is unclear as to whether or not data on these variables were ever collected.

[15] Discrepancy discovered in 2016 codebook review - HLTHCOV6 and HLTHCOV7 appear in 1989 and 1990 datasets, however their listed formats do not appear in Part IV: Categorical Variable Formats, nor do the questions appear in the questionnaires. Therefore, there is no documentation on what the answer choices mean for these questions. Based on frequencies, it appears that HLTHCOV7 is a recode, collapsing HLTHCOV6's values of 4-5, and 7-8.

---

[16] Beginning in 2014, core BRFSS interviews conducted by other states with California residents who have cell phone numbers with area codes originating from other states are now included in the dataset. The CA version of income (INCOM02) has more answer categories than the CDC version (INCOMCDC). Respondents with data collected by other states answered the CDC version of income (INCOMCDC) not the state version (INCOM02). Therefore, they are missing values in INCOM02, but have values in INCOMCDC.

[17] Beginning in 2014, core BRFSS interviews conducted by other states with California residents who have cell phone numbers with area codes originating from other states are now included in the dataset. The CA version of race has more answer categories for the Asian subgroups than the CDC version. Respondents with data collected by other states answered the CDC version of race (MRACE1) not the state versions (ORACE2AB, ORACE2AB_1 thru ORACE2AB_19). Therefore, they are missing values in the state Asian subgroups questions, but have values in MRACE1.

---

[19] Discrepancy discovered during 2016 codebook review – The answer format for _POVSTB is not listed in PART IV: CATEGORICAL VARIABLE FORMATS, nor is there clear indication of what the answer choices mean from the questionnaires. Our best hypothesis is that the answer choices are the following, however, we cannot be certain as there is no documentation:
1=BELOW POVERTY
2=100%- 200%
3=200% - 300%
4=< 100%
5=< 200%
6=< 300%

---

[20] In 2008, FLUPLAC4 should have been renamed as there was a change in answer format, however it was not and there now exist two FLUPLAC4 variables. If conducting a multi-year analysis with both of these variables, investigators should change the name of one of these variables before merging the datasets.

[21] In 2011, physical activity variables were calculated using activity Metabolic Equivalent Task (MET) values, which are physiological measures of the amount of energy the body uses during physical activity. The MET values were calculated by age, gender, physical activity status and type of physical activity. For more information on the calculated variables for physical activity, please see the 2011 Calculated Variable document that contains the SAS code used to create the physical activity variables at: http://www.cdc.gov/BRFSS/annual_data/annual_2011.htm

PART VI: WEIGHTS

As discussed in Part I, the characteristics of survey respondents do not exactly match the population's characteristics when compared by gender, race/ethnicity, and age. In addition, the probability of selection within a household is different for different households. For these reasons, a final weight must be applied in all analyses in order to obtain estimates that are representative of and generalizable to the CA population. Beginning in 2014, two separate groups of weights are provided: 1) the CDC calculated weights; and 2) the CA calculated weights. Current and prior weighting procedures are discussed below. The final weights are described in detail in Table IV. Survey design variables should also be included in analyses (see Analysis Guidelines below).

Changes in weighting methodology occurred in 2011 for the CDC calculated weights (see CDC documentation[22]) and in 2012 for the CA calculated weights (see below). Due to these changes (and 2012 changes in sampling methodology described in Part I: BRFSS Technical Report) there are 2 year ranges within, but not between, which trend analyses may be conducted with each set of weights provided:
- CDC weights: 1984 – 2010 and 2011 – present
- CA weights: 1984 – 2011 and 2012 – present

Due to these changes, estimates from each of the year ranges listed above are not comparable. PRC and CDC recommend NOT conducting trend analyses where estimates from any of the two year ranges are compared with another of the year ranges.

CDC Weighting Procedures – (provided beginning 2014)[23]

Please refer to the CDC's BRFSS Data Documentation for more detailed information on weighting and weighted variables. [24] The information provided here is from the CDC documentation.

As noted above, beginning in 2014, CA BRFSS data is being weighted by the CDC to be consistent with national weighting procedures. The CDC provides a great deal of information about BRFSS data, weighting, and SAS resources on the CDC BRFSS website.[11] CDC uses raking and trimming to calculate final weights in order to reduce sampling error in outcome estimates. The CDC uses three different sources of population estimates to weight data. First, intercensal population estimates were purchased from The Nielsen Company, LLC at the county-level for age, race/ ethnicity, and gender. These population estimates are used as the population totals for all states across all margins. Second, the American Community Survey PUMS dataset (2009-2013) was used to obtain estimates for education, marital status, and tenure. Non-Institutionalized adults were weighted by the person-level weights to generate accurate population estimates. These percentages are used for raking these margins. Third, to get appropriate telephone type estimates (cellphone compared to landline), data are taken from the state wireless estimate percentages produced by the National Center for Health Statistics and released in December 2013.

---

[22] Centers for Disease Control and Prevention, BRFSS 2011 Survey and Documentation. Available at: http://www.cdc.gov/BRFSS/annual_data/annual_2011.htm

[23] CDC created weights for all years of data collection but were not provided in the CA dataset until 2014. Previous years CDC datasets with CDC weights are available upon request.

[24] www.cdc.gov/brfss/annual_data/annual_data.htm. Documentation available for each year of data collection.

Using Weights for Multiple Survey Tracks (Versions)
Weights exist for each of the tracks (or versions) of the current BRFSS survey as well as the entire sample. In years when there are three tracks, there are weights for each combination of 2 tracks (i.e., 1 and 2; 2 and 3; 1 and 3), but CDC does not compute these weights. However, should a 2 track weight be needed because a variable is available across 2 but not all 3 tracks (in years where there are 3 tracks), single track weights can be simply adjusted and then both used in the place of a 2 track weight. What variables are available on which tracks can be determined by using the variable "VERSION" or by reviewing the survey instrument, which is available upon request.

Each track weight to be used should be multiplied by the proportion of sample in that track out of the sample in both tracks being used. For example, if you wish to get a population estimate for a variable available on tracks 1 and 2 you would use the appropriate weight for track 1 multiplied by:

$$\frac{N_1 \text{ (sample size of track 1)}}{(N_1 + N_2)}$$

In addition you would also use the appropriate weight for track 2 multiplied by:

$$\frac{N_2 \text{ (sample size of track 2)}}{(N_1 + N_2)}$$

Design Weight Correction for Overlapping Sample Frame
The partial overlapping sample frames required an adjustment to address the respondent's probability of selection in both the landline sample frame and cell phone sample frame. The adjustment to the design weights was made to records identified as available in both sample frames. This adjustment creates three possible telephone source contacts categories. These include: Landline frame with a cell phone, Cellphone frame with a landline, and No Dual Phone use.

The compositing factor was calculated for the cellular mostly overlapping sample frame users. For the cell mostly overlapping sample frame telephone service categories calculate compositing factor:

N effective = N/ DEFFf, Where: N is the unweighted number of interviews, and DEFF + 1 + (Standard deviation of design_wt/ Mean value of design_wt)^2

_DUALUSE is the variable used to identify the Dual Phone use categories (_DUALUSE = 1 Landline with a Cellphone, _DUALUSE= 2 with a Landline, _DUALUSE = 9 No Dual Phone Use); _WT2RAKE is the design weight.

2014 Design Truncation
The design weight calculation is implemented separately for the landline sample (within _GEOSTR) and the cell phone sample (within _GEOSTR). In addition to the overlapping sample frame correction to the design weight, the combined landline and cell phone design has been truncated within _REGION prior to the raking. The primary purpose of the design weight is truncation is to prevent any adults in a state from carrying extremely large weights into the raking. A secondary goal is to prevent any adults from having extremely small design weights. The landline design weight has been truncated within the _REGION prior to raking based on quartiles. _LANDWT2 holds the truncated design weight. The child design weights have not been truncated

prior to raking.

2014 Integrated Weight
The 2014 integrated weight includes the nine state level margins (sex, age, race, county, etc.) and allows for up to eight additional margins to take advantage of additional adjustments to sub-state populations within the raking. There are four additional margins if a county has at least 500 interviews available. There are also four additional margins for _REGION, if multiple regions have been defined for a state and each region has at least 500 interviews.

Order of Margins
Ideally, convergence would be obtained quickly and all margins would achieve agreement with specified population control totals. Since this is not always feasible for all sixteen margins due to the complexity of the weighting system, certain margins should march population control totals exactly and in the few difficult cases where the raking algorithm has not completely converged or has reached the point of diminishing returns, the algorithm may stop without matching a few of the margins exactly. The last margin will almost always be very close to the population control totals.

For the 2014 integrated weight the key state-level margins are as follows for adults:

Margin Number	Margin Variable Name	Margin Characteristics
First Margin:	_LLCPM01	Age-Gender
Second Margin:	_LLCPM02	Race/Ethnicity
Third Margin:	_LLCPM03	Education
Fourth Margin:	_LLCPM04	Marital Status
Fifth Margin:	_LLCPM05	Home Ownership
Sixth Margin:	_LLCPM06	Gender-Race/Ethnicity
Seventh Margin:	_LLCPM07	Age-Race/Ethnicity
Eighth Margin:	_LLCPM08	Telephone Source
Ninth Margin:	_LLCPM09	Regions
Tenth Margin:	_LLCPM10	Regions-Age
Eleventh Margin:	_LLCPM11	Regions-Gender
Twelfth Margin:	_LLCPM12	Regions-Race/Ethnicity
Thirteenth Margin:	_LLCPM13	Counties
Fourteenth Margin:	_LLCPM14	Counties-Race/Ethnicity
Fifteenth Margin:	_LLCPM15	Counties-Age
Sixteenth Margin:	_LLCPM16	Counties-Sex

CA Weighting Procedures (Raking) – 2012 - present

From 2012-2014, CA BRFSS used raking to calculate final weights. California DOF population estimates are utilized to weight the data. The procedures to calculate these weights are described below.

Base Weight
The probability of selection for a household in the survey is the base weight, STRWT. STRWT is the inverse of the sampling fraction for each stratum and is defined as:

STRWT = Average number of telephone banks when sample drawn *100
                      Total number of telephone numbers sampled

Part VI: Weights

Design Weight
The design weight adjusts for probability of selection (DESGNWT). Specifically, this weight takes the following factors into account: 1) the base weight, which compensates for differential probability of selection of households (STRWT), and 2) accounts for multiple residential telephone lines in the household among respondents in the landline frame (APA).

DESGNWT = STRWT *APA

To compensate for differential probability of selection of households, the base weight is applied (STRWT). It is necessary to adjust for multiple residential telephone lines within a household because, for example, a household with two residential telephone lines is twice as likely to be selected for inclusion in the survey compared to a household with only one telephone line. Adjustment is made using APA, which equals 1 divided by/number of telephones in household multiplied by number of adults in household (1/(number phones *number adults). In the cell phone frame, APA equals 1 because no household respondent selection occurs.

Final Weights for Use in Analyses
Next, the design weight was manipulated using raking to produce final weights for use in data analysis. The final weights adjust for both probability of selection and variability in sex, age, race/ethnicity, and source of interview (cell phone versus landline) between the sample and the population.

Population estimates, or control totals, for the raking were obtained from the California DOF 2010 (gender, race/ethnicity, and age)[25] and the National Center for Health Statistics (phone source).[26] The cell phone sampling frame included those who received all or most of their calls on the cell phone. Proportions for cell phone only and cell phone mostly were summed from Blumberg et al.'s report to use as population estimates for cell phone use. The categories used for the population estimates are described below.

Race/ethnicity categories. Race/ethnicity was used as a 2-category (_RACEG) and a 4-category variable (_RACEGR). As a 2-category variable, these categories were used: non-Hispanic White versus non-White. As a 4-category variable, these categories were used: non-Hispanic White; non-Hispanic Black; Hispanic/Latino; non-Hispanic Asian, Pacific Islander, American Indian, Alaska Native, and other race/ethnic groups.

Age categories. The age categories used were ten-year categories ending at mid-decade (_AGEG: 18-24 years, 25-34 years, 35-44 years, 45-54 years, 55-64 years, 65+ years) or two-year age categories (_AGEGC: 18-44 years, 45+ years).

Sex categories. The sex categories used to create weights were female and male (SEX).

Phone source. In 2012, when a cell phone only frame was added to the CA BRFSS, an additional 2-category variable for phone source (SOURCE: landline frame, cell phone frame) was used in creating the weights.

---

[25] Estimates from California Department of Finance 2010, Summary file 1. Available at: http://www.dof.ca.gov/research/demographic/state_census_data_center/census_2010/. Accessed on August 15, 2012.
[26] Blumberg, S.J., et al. Wireless Substitution: State-level Estimates from the National Health Interview Survey, January 2007 – June 2010. National Health Statistics Reports, no. 39, April 20, 2011

Within categories, all weights sum to the current standard population estimate of 27,958,916 adults in California. A convergence criterion (tolerance) of 0.025 was used as the cut point for the maximum difference between control totals and the corresponding total of adjusted weights. Raking was considered complete when, within each raking variable's categories (age, gender, race/ethnicity, and source), all marginal totals differed from control totals by 0.025 or less. SAS software (SAS Institute Inc., Cary, North Carolina) was used to rake the data, using a program adapted from Izrael et al.[27]

CA Weighting Procedures (Post-stratification) – 1984 – 2011

From 1984 – 2011, CA BRFSS used post-stratification to calculate final weights. California DOF population estimates are utilized to weight the data. The process to calculate these weights is described below. Weights in survey years 1984 – 2012 combine post-stratification weighting and probability of selection adjustments. These weights correct the age, race, and sex distribution of the BRFSS sample so that it matches the demographics of the California population. The probability of selection adjustments used in creating the weights take into account the following factors: number of adults in the household, number of unique telephone numbers in the household and the number of interviews completed within a primary sampling unit (if necessary; only done for certain years).

Population estimates were obtained from the California DOF for age, race/ethnicity, and sex. For CA BRFSS 2010 – 2012, CA DOF estimates from 2010 and 2000 were used to create weights. For CA BRFSS 1984 – 2009, CA DOF estimates from 2000 were used to create weights. For CA BRFSS1984 – 2004, CA DOF estimates from 1990 were used to create weights. All weights are constructed so that they sum to a standard population from CA DOF estimates. Various groups of race/ethnicity, age, and sex were used to create the weights. Categories used are described below.

Race/ethnicity categories. Race/ethnicity was used as a 2-category (_RACEG) and a 4-category variable (_RACEGR). As a 2-category variable, these categories were used: non-Hispanic White versus non-White. As a 4-category variable, these categories were used: non-Hispanic White; non-Hispanic Black; Hispanic/Latino; non-Hispanic Asian, Pacific Islander, American Indian, Alaska Native, and other race/ethnic groups.

Age categories. The age categories used were ten-year categories ending at mid-decade (_AGEG: 18-24 years, 25-34 years, 35-44 years, 45-54 years, 55-64 years, 65+ years) or two-year age categories (_AGEGC: 18-44 years, 45+ years).

Sex categories. The sex categories used to create weights were female and male (SEX).

In Table IV, more details are given about which weights are available for which survey year, and recommendations are included about which weights to use for which year, and (when applicable) with specific survey tracks.

Weighting Naming Conventions 1984-2013

The weighting naming conventions have remained the same from 1984 – 2013, even though the methodology to calculate the weights was revised in 2012. Weights that begin with '_WT' are for

---

[27] Izrael D., D.C. Hoaglin, and M.P. Battaglia. A SAS Macro for Balancing a Weighted Sample. SAS Users Group International Conference, Statistics and Data Analysis, Paper #258-25

use in analyses using data from 1 track. Weights that begin with '_CWT' are for use in analyses using data from more than 1 track. Weights that include '90' were created using the CA DOF estimates from 1990. Weights that include '00' were created using the CA DOF estimates from 2000. Weights that include '10' were created using the CA DOF estimates from 2010.

For example, the weight called '_WT10' is for use with analyses using data from 1 track and was created use population estimates from CA DOF 2010. For more details about the differences between the weights, see Table IV.

Weighting Recommendations

When conducting analyses of BRFSS data, data users should consider carefully which weight or weights to select, as different weights can yield different results. It is possible that after reviewing the weights available on the dataset, data users may find that none of the weights provided suits the needs of the planned analysis. If this is the case, we recommend consulting with a statistician familiar with weighting procedures for assistance in developing weights appropriate to the analytical task. In general, when performing weighted analyses that calculate prevalence rates for age or race groups, it is preferable to use the categories that were used in creating the weights, or aggregations of those categories.

Data users should be aware that these weights were developed for analyses of the California population. Breakdowns by smaller geographic areas, such as region or county, should be undertaken with extreme caution, as the weights provided here may yield biased point estimates for populations that are different demographically than the California population as a whole.

Finally, data users should be aware that demographic differences necessitating use of weights in analyses are separate from the design effects that are introduced through the multi-stage cluster sampling technique used from 1984 to 1993 to obtain the sample.

Analysis Guidelines

In addition to the weight variables, survey design variables should be used to conduct a design-based analysis using survey software. For analyses, two survey design variables should be used: 1) _STSTR, a stratification variable that is a cross-classification of GEOSTR and DENSTR, and 2) a final weight variable (see Table IV). The variable _STSTR incorporates information about the sampling plan into the analysis to account for sampling error; see Part I: BRFSS Technical Report for additional historical information. Sample SAS syntax for use with 2016 data:

```
PROC SURVEYFREQ;
STRATA _STSTR;
WEIGHT _CWT10R4;
TABLE GENHLTH;
RUN;
```

See the CDC's Comparability of Data reports for further guidance on preforming analyses with BRFSS data.[28] For more information about using analyzing survey data and sample code, please see the following resources:

---

[28] www.cdc.gov/brfss/annual_data/annual_data.htm. Documentation available for each year of data collection.

- UCLA Institute for Digital Research and Education ‑ Statistical Computing Seminars: Introduction to Survey Data Analysis
  http://www.ats.ucla.edu/stat/seminars/svy_intro/default.htm
- SAS Knowledge Base‑ Sample Survey Design and Analysis 2The CDC weights are year-specific (weights created based on the most recent year of population data available and therefore based on different population data each year) the CA DOF weights are not year-specific, as they date back to the most recent DOF statistics available (release every 10 years). Year specific weights should be used when the purpose of the analysis is to obtain the most accurate point estimate possible for a given year. As an example, it might be of interest to know the prevalence of hypertension among Californians in 2009 using weights that force the data to be representative of the California population in 2009.

Multiple-year weights are NOT included in the dataset. Multiple-year weights should be created when two or more sample years of BRFSS data are aggregated for analytical purposes. So, for example, if one wanted to examine the prevalence of young adults who are obese and compare by race/ethnicity, it might be necessary to aggregate years (such as 2008, 2009, and 2010) in order to obtain a large enough sample size. It would then be appropriate to create multiple-year weights to be used in the analysis. If such weights are necessary, consult with a statistician familiar with weighting procedures for assistance in developing weights appropriate to the analytical task.

Age-adjusted weights are NOT included in the dataset. Age-adjusted weights differ from the other weights in that within gender each race group is adjusted to a common age distribution. This allows for comparisons across race groups without the confounding effects that might be introduced by differences in the age distribution of these groups. For example, there is a positive relationship between age and the prevalence of hypertension; the older a population is, the greater the prevalence of hypertension. If one were performing an analysis comparing the prevalence of hypertension among Blacks, Whites, Hispanics, and others, without age-adjusting, it would not be possible to determine what, if any, difference in hypertension prevalence there may be among these groups because their age distributions are different. If such weights are necessary, consult with a statistician familiar with weighting procedures for assistance in developing weights appropriate to the analytical task.

Table IV: BRFSS Final Weights

Table IV.a

CDC Weights
(Please refer to the CDC's BRFSS Data Documentation for detailed information on weighting and weighted variables.) [29]

Variable	Weight Description	Years
_CLANDWT	FINAL CHILD WEIGHT: LAND-LINE DATA ONLY	2014-2015
_CLCWTV1	VERSION 1 CHILD WEIGHT: LAND-LINE AND CELL-PHONE DATA	2014-2020
_CLCWTV2	VERSION 2 CHILD WEIGHT: LAND-LINE AND CELL-PHONE DATA	2014-2020

Table IV.b

CA Weights: Utilizing California Department of Finance (DOF) 2010 population estimates

Variable	Used to Create Weight	Weight Description	Years
_CWT10	_AGEG _RACEG SEX (2011-2015) SEX1 (2016-2017) SEX2 (2018-2020)	Weights to 2010 population estimates from CA DOF. Use when analyzing data on 3 tracks.	2011-2016, 2018-2020
_CWT102	_AGEG _RACEG SEX (2011-2015) SEX1 (2016-2017) SEX2 (2018-2020)	Weights to 2010 population estimates from CA DOF. Use when analyzing data on both tracks 1 and 2.	2011-2020
_CWT10B	_AGEGC _RACEGR SEX (2011-2015) SEX1 (2016-2017) SEX2 (2018-2020)	Weights to 2010 population estimates from CA DOF. Use when analyzing data on 3 tracks.	2011-2016, 2018-2020
_CWT10B2	_AGEGC _RACEGR SEX (2011-2015) SEX1 (2016-2017) SEX2 (2018-2020)	Weights to 2010 population estimates from CA DOF. Use when analyzing data on both tracks 1 and 2.	2011-2019
_CWT10R4	_AGEG _RACEGR SEX (2011-2015) SEX1 (2016-2017) SEX2 (2018-2020)	Weights to 2010 population estimates from CA DOF. Use when analyzing data on 3 tracks.	2011-2016, 2018-2020
_CWT10R42	_AGEG _RACEGR SEX (2011-2015) SEX1 (2016-2017) SEX2 (2018-2020)	Weights to 2010 population estimates from CA DOF. Use when analyzing data on both tracks 1 and 2.	2011-2020
_WT10	_AGEG _RACEG SEX (2011-2015) SEX1 (2016-2017) SEX2 (2018-2020)	Weights to 2010 population estimates from CA DOF. Use when analyzing data on only 1 track.	2011-2020
_WT10B	_AGEGC _RACEGR SEX (2011-2015) SEX1 (2016-2017) SEX2 (2018-2020)	Weights to 2010 population estimates from CA DOF. Use when analyzing data on only 1 track.	2011-2020
_WT10R4	_AGEG _RACEGR SEX (2011-2015) SEX1 (2016-2017) SEX2 (2018-2020)	Weights to 2010 population estimates from CA DOF. Use when analyzing data on only 1 track.	2011-2020

Part VI: Weights

Table IV.c

CA Weights: Utilizing California Department of Finance (DOF) 2000 population estimates

Variable	Used to Create Weight	Weight Description	Years
_WT00	_AGEG _RACEG SEX	Weights to 2000 population estimates from CA DOF. Use when analyzing data on only 1 track.	1984-2011
_WT00B	_AGEGC _RACEGR SEX	Weights to 2000 population estimates from CA DOF. Use when analyzing data on only 1 track.	1984-2011
_WT00R4	_AGEG _RACEGR SEX	Weights to 2000 population estimates from CA DOF. Use when analyzing data on only 1 track. NOTE: For analyses using single years of data, do not use prior to 1992 due to small sample size in non-White groups.	1984-2011
_CWT00B2	_AGEG _RACEG SEX	Weights to 2000 population estimates from CA DOF. Use when analyzing data on both tracks 1 and 2.	2009-2011
_CWT00R42	_AGEGC _RACEGR SEX	Weights to 2000 population estimates from CA DOF. Use when analyzing data on both tracks 1 and 2.	2009-2011
_CWT00	_AGEG _RACEG SEX	Weights to 2000 population estimates from CA DOF. Use when analyzing data on all 3 tracks.	2008-2011
_CWT00B	_AGEGC _RACEGR SEX	Weights to 2000 population estimates from CA DOF. Use when analyzing data on all 3 tracks.	2008-2011
_CWT00R4	_AGEG _RACEGR SEX	Weights to 2000 population estimates from CA DOF. Use when analyzing data on all 3 tracks.	2008-2011

Table IV.d

CA Weights: Utilizing California Department of Finance (DOF) 1990 population estimates

Variable	Used to Create Weight	Weight Description	Years
_WT90N (Check labels in datasets. Variable name may begin with _PST and not _WT in some years)	_AGEG _RACEG SEX	Weights to 1990 population estimates from CA DOF. Use when analyzing data on only 1 track. NOTE: Due to low sample sizes in datasets from 1984 – 1992, this is the preferred weight for analyses using data from those years.	1984-2004
_WT90BN (Check labels in datasets. Variable name may begin with _PST and not _WT in some years)	_AGEGC _RACEGR SEX	Weights to 1990 population estimates from CA DOF. Use when analyzing data on only 1 track.	1984-2004
_WT90R4N (Check labels in datasets. Variable name may begin with _PST and not _WT in some years)	_AGEG _RACEGR SEX	Weights to 1990 population estimates from CA DOF. Use when analyzing data on only 1 track. NOTE: For analyses using single years of data, do not use prior to 1992 due to small sample size in non-White groups.	1984-2004

PART VII: CALCULATED VARIABLES

Responses to some survey questions have been combined to create more easily analyzed categories. These variables can easily be identified because the names start with an underscore (e.g., _RFSMOKE). This section presents some of the recent calculated variables and explains how they were created. The SAS program, which created the variables, is available on request. For information on older calculated variables please contact PRC.

Demographic Variables

Age, Race, and Ethnicity
Calculated race variables combine responses to questions concerning race (ORACE) and ethnicity (HISPANIC). In all cases, persons of Hispanic origin are categorized as Hispanic, regardless of race. Respondents who did not answer questions concerning age and race have been excluded from the database, as appropriate weights could not be calculated.

Variable	Label	Format	Coding
_AGEG	TEN YEAR AGE CATEGORY	_AGEG.	1=18-24 2=25-34 3=35-44 4=45-54 5=55-64 6=65+
_AGEGB	TEN YEAR AGE CATEGORY, AT DECADE	_AGEGB.	1=18-29 2=30-39 3=40-49 4=50-59 5=60+
_AGEGC	TWO AGE CATEGORIES	_AGEGC.	1=18-44 2=45+
_RACE	RACE, 8 CATEGORIES	_RACE.	1=White, Non-Hispanic 2=Black, Non-Hispanic 3=White Hispanic 4=Black Hispanic 5=Other Hispanic 6=Asian/Pacific Islander 7=Aleutian, Eskimo or American Indian 8=Other 77=Unknown 99=Refused
_RACEG	RACE, WHITE-NONWHITE	_RACEG.	1=Non-Hispanic White 2=All Others 9=Refused
_RACEGR	RACE, 4 CATEGORIES	_RACEGR.	1=White 2=Black 3=Hispanic 4=Other 9=Refused

Poverty Status
The poverty status variables (_POVST, _ POVSTB, _ POVSTC, _ POVSTD) indicate the household poverty level compared to the federal poverty line[30]. This variable is created using household size (HHSIZE), and household income level (INCOME, INCOM01, INCOM02,

---

[30] For 2014: Federal Register, Vol. 79 No. 14, January 22, 2014, pp. 3593-4.

INCOM94, INCOMCDC).

Diabetes

The diabetes core questions as developed by CDC rely upon women to correctly identify whether they have gestational diabetes. Because of concerns that some women with gestational diabetes were not reporting the correct type of diabetes, the CA BRFSS began asking female respondents who reported having diabetes specifically about gestational diabetes (variable name DIABGEST). Using the CA BRFSS dataset to determine diabetes prevalence, one must use both the question (DIABCOR1 or DIABCOR2) and DIABGEST to construct a variable we have named DIABCDC in this example.

> IF DIABCOR2=1 (YES) then DIABCDC=1 (YES).
> IF DIABCOR2=3 (GESTATIONAL) THEN DIABCDC=2 (GESTATIONAL).
> IF DIABCOR2=2 (NO DIABETES) THEN DIABCDC=3 (NO DIABETES).
> IF DIABCOR2=4 (PREDIABETES) THEN DIABCDC=4 (PREDIABETES).
> > (CDC began asking about pre-diabetes or borderline diabetes in 2004.)
>
> IF DIABGEST=1 (YES) THEN DIABCDC=2 (GESTATIONAL).
> IF DIABGEST=2 (NO) THEN DIABCDC=1 (YES, HAS DIABETES).

Fruit and Vegetable Consumption

In some years, the CA BRFSS contained a module written by CDC which assessed fruit and vegetable consumption. Participants were asked to specify how often they ate the specified food per day, week, month or year. Variables _CARROT, _FRUIT90, _JUICE, JUICE94, _POTATO, _SALAD and _VEG90 have converted all responses to times per day, without rounding of fractions. Responses of unknown or refused are set to missing. _DIET is the truncated sum of these six variables; that is, any sum less than 1 is set to zero, any sum between 1 and 2 is set to 1, etc. If any of the six responses were unknown or refused, _DIET was set to missing. Note that these questions assess the number of times the food is eaten per day, not the number of servings, and that certain foods are specifically excluded (e.g., french fries, fried potatoes and potato chips).

Variable	Label	Format	Coding
_BEANDAY	BEAN INTAKE IN TIMES PER DAY	Continuous variable	Unknown/refused set to missing
_BEANS11	HOW OFTEN EAT , NOT INCLUDING GREEN BEANS PER DAY	Continuous variable	Unknown/refused set to missing
_CARROT	HOW OFTEN EAT CARROTS PER DAY	Continuous variable	Unknown/refused set to missing
_DIET	HOW OFTEN EAT FRUITS AND VEG/DAY	Continuous variable	Unknown/refused set to missing
_DIET11	HOW OFTEN EAT FRUITS AND VEG/DAY	Continuous variable	Unknown/refused set to missing
_FRNCHDA	FRENCH FRY INTAKE IN TIMES PER DAY	Continuous variable	Unknown/refused set to missing
_FRT16	REPORTED CONSUMING FRUIT > 16 PER DAY	Continuous variable	Unknown/refused set to missing
_FRT16A	REPORTED CONSUMING FRUIT >16/DAY	_INC.	0=Not included-values are too high 1=Included-values are in accepted range
_FRTLT1	CONSUME FRUIT 1 OR MORE TIMES PER DAY	Continuous variable	Unknown/refused set to missing

Part VII: Calculated Variables

Variable	Label	Format	Coding
_FRTLT1A	CONSUME FRUIT 1 OR MORE TIMES PER DAY	_CONS.	1=Consumed fruit/ vegetable one or more times per day 2=Consumed fruit/ vegetable less than one time per day 9=Don't know/ refused/ missing
_FRTRES1	MISSING ANY FRUIT RESPONSES	_INC.	0=Not included-values are too high 1=Included-values are in accepted range
_FRTRESP	MISSING ANY FRUIT RESPONSES	Continuous variable	Unknown/refused set to missing
_FRUIT90	HOW OFTEN EAT FRUIT PER DAY	Continuous variable	Unknown/refused set to missing
_FRUIT2	HOW OFTEN EAT FRUIT PER DAY	Continuous variable	Unknown/refused set to missing
_FRUIT11	HOW OFTEN EAT FRUIT PER DAY	Continuous variable	Unknown/refused set to missing
_FRUTDA1	FRUIT INTAKE IN TIMES PER DAY	Continuous variable	Unknown/refused set to missing
_FRUTDA2	COMPUTED FRUIT INTAKE IN TIMES PER DAY	Continuous variable	Unknown/refused set to missing
_FRUITE1	FRUIT EXCLUSION FROM ANALYSES	_EXC.	0=No missing values and in accepted range 1=Missing fruit/ vegetable responses 2=Fruit/ vegetable values out of range
_FRUITEX	FRUIT EXCLUSION FROM ANALYSIS	Continuous variable	Unknown/refused set to missing
_FRUTSU1	TOTAL FRUITS CONSUMED PER DAY	Continuous variable	Unknown/refused set to missing
_FRUTSUM	TOTAL FRUITS CONSUMED PER DAY	Continuous variable	Unknown/refused set to missing
_FTJUDA1	FRUIT JUICE INTAKE IN TIMES PER DAY	Continuous variable	Unknown/refused set to missing
_FTJUDA2	COMPUTED FRUIT JUICE INTAKE IN TIMES PER DAY	Continuous variable	Unknown/refused set to missing
_GRENDA1	COMPUTED DARK GREEN VEGETABLE INTAKE IN TIMES PER DAY	Continuous variable	Unknown/refused set to missing
_GRENDAY	DARK GREEN VEGETABLE INTAKE IN TIMES PER DAY	Continuous variable	Unknown/refused set to missing
_JUICE	HOW OFTEN DRINK FRUIT JUICE PER DAY	Continuous variable	Unknown/refused set to missing
_JUICE2	HOW OFTEN DRINK FRUIT JUICE PER DAY	Continuous variable	Unknown/refused set to missing
_JUICE11	HOW OFTEN DRINK 100% PURE FRUIT JUICE PER DAY	Continuous variable	Unknown/refused set to missing
_JUICE94	HOW OFTEN DRINK FRUIT JUICE PER DAY	Continuous variable	Unknown/refused set to missing
_MISFRT1	THE NUMBER OF MISSING FRUIT RESPONSES	Continuous variable	Unknown/refused set to missing
_MISFRTN	NUMBER OF MISSING FRUIT RESPONSES	Continuous variable	Unknown/refused set to missing
_MISVEG1	THE NUMBER OF MISSING VEGETABLE RESPONSES	Continuous variable	Unknown/refused set to missing
_MISVEGN	NUMBER OF MISSING VEGETABLE RESPONSES	Continuous variable	Unknown/refused set to missing

Part VII: Calculated Variables

Variable	Label	Format	Coding
_MIXEDVG	HOW OFTEN EAT MIXED VEG PER DAY	Continuous variable	Unknown/refused set to missing
_ORNGDAY	ORANGE-COLORED VEGETABLE INTAKE IN TIMES PER DAY	Continuous variable	Unknown/refused set to missing
_OTHRVE11	HOW OFTEN EAT OTHER VEGETABLES PER DAY	Continuous variable	Unknown/refused set to missing
_POTADA1	COMPUTED POTATO SERVINGS PER DAY	Continuous variable	Unknown/refused set to missing
_POTATO	HOW OFTEN EAT POTATOES PER DAY	Continuous variable	Unknown/refused set to missing
_POTATO2	HOW OFTEN EAT POTATOES PER DAY	Continuous variable	Unknown/refused set to missing
_SALAD	HOW OFTEN EAT GREEN SALAD PER DAY	Continuous variable	Unknown/refused set to missing
_SALSA	HOW OFTEN EAT SALSA PER DAY	Continuous variable	Unknown/refused set to missing
_VEG02	HOW MANY SERVINGS OTHER VEG/DAY	Continuous variable	Unknown/refused set to missing
_VEG23	REPORTED CONSUMING VEGETABLES > 23 PER DAY	Continuous variable	Unknown/refused set to missing
_VEG23A	REPORTED CONSUMING VEGETABLES >23/DAY	_INC.	0=Not included-values are too high 1=Included-values are in accepted range
_VEG90	HOW MANY SERVINGS OTHER VEG/DAY	Continuous variable	Unknown/refused set to missing
_VEGEDA1	VEGETABLE INTAKE IN TIMES PER DAY	Continuous variable	Unknown/refused set to missing
_VEGEDA2	COMPUTED OTHER VEGETABLE INTAKE IN TIMES PER DAY	Continuous variable	Unknown/refused set to missing
_VEGESU1	TOTAL VEGETABLES CONSUMED PER DAY	Continuous variable	Unknown/refused set to missing
_VEGESUM	TOTAL VEGETABLES CONSUMED PER DAY	Continuous variable	Unknown/refused set to missing
_VEGETE1	VEGETABLE EXCLUSION FROM ANALYSES	_EXC.	0=No missing values and in accepted range 1=Missing fruit/ vegetable responses 2=Fruit/ vegetable values out of range
_VEGETEX	VEGETABLE ECLUSION FROM ANAYSES	Continuous variable	Unknown/refused set to missing
_VEGGRE11	HOW OFTEN EAT DARK GREEN VEGETABLES PER DAY	Continuous variable	Unknown/refused set to missing
_VEGLT1	CONSUME VEGETABLES 1 OR MORE TIMES PER DAY	Continuous variable	Unknown/refused set to missing
_VEGLT1A	CONSUME VEGETABLES 1 OR MORE TIMES PER DAY	_CONS.	1=Consumed fruit/ vegetable one or more times per day 2=Consumed fruit/ vegetable less than one time per day 9=Don't know/ refused/ missing
_VEGORA11	HOW OFTEN EAT ORANGE COLORED VEGETABLES PER DAY	Continuous variable	Unknown/refused set to missing
_VEGRES1	MISSING ANY VEGETABLE RESPONSES	_INC.	0=Not included-values are too high 1=Included-values are in accepted range

Part VII: Calculated Variables

Variable	Label	Format	Coding
_VEGRESP	MISSING ANY VEGETABLE RESPONSES	Continuous variable	Unknown/refused set to missing

Prostate Cancer Screening

In alternating years since 1993 the BRFSS has collected information on knowledge ("Have you ever heard of..."), use ("Have you ever had...") and time since last examination ("When was the last time you had...") for prostate cancer screening (the screening test: prostate specific antigen (PSA)). Responses to these questions have been combined into the variables _PSA1 and _PSA2. Participants are divided into two groups: those who never had the exam, including those who stated that they had never heard of the exam, and those who had the exam at least once. Note that someone who stated that they had the exam, but are unable or unwilling to state how long ago the exam took place, are coded as 9 ("Unknown/Refused") in the second series, but are coded as 2 ("Ever Had") in the first series. Therefore, the number of respondents in category 2 in the first series may be slightly larger than the sum of participants in categories 3-5 in the second series.

Variable	Label	Format	Coding
_PSA1	NEVER/EVER HAD PSA EXAM	_PAPC.	1=Never Had 2=Ever Had 9=Unknown/Refused'
_PSA2	PSA STATUS	_PSAB.	1=Never had 2=Had w/in last yr 3=Had w/in 2 yrs 4=Had w/in 5 yrs 5=Had > than 5 yrs ago 9=Unknown/Refused'
_PSA3	NEVER/EVER HAD PSA EXAM	_PAPC.	1=Never Had 2=Ever Had 9=Unknown/Refused'
_PSA4	PSA STATUS	_PSAB.	1=Never had 2=Had w/in last yr 3=Had w/in 2 yrs 4=Had w/in 5 yrs 5=Had > than 5 yrs ago 9=Unknown/Refused'

Colorectal Cancer Screening

Colon and rectum cancer screening questions have changed numerous times over the years, making it challenging to analyze the data. A few variables for proctoscopy and sigmoidoscopy have been created to help in this process. Participants are divided into two groups: those who never had the exam, including those who stated that they had never heard of the exam, and those who had the exam at least once. Note that someone who stated that they had the exam, but are unable or unwilling to state how long ago the exam took place, are coded as 9 ("Unknown/Refused") in the second series, but are coded as 2 ("Ever Had") in the first series. Therefore, the number of respondents in category 2 in the first series may be slightly larger than the sum of participants in categories 3-5 in the second series.

Variable	Label	Format	Coding
_PROC193	NEVER/EVER HAD PROCTOSCOPY	_COLRECA.	1=Never Had 2=Ever Had 9=Unknown/Refused'

Part VII: Calculated Variables

_PROC293	PROCTOSCOPY STATUS	_COLRECB.	1=Never had 2=Had w/in last yr 3=Had w/in 2 yrs 4=Had w/in 5 yrs 5=Had > than 5 yrs ago 9=Unknown/Refused'
_PROCTO1	NEVER/EVER HAD PROCTOSCOPY	_COLRECA.	1=Never Had 2=Ever Had 9=Unknown/Refused'
_PROCTO2	PROCTOSCOPY STATUS	_COLRECB.	1=Never had 2=Had w/in last yr 3=Had w/in 2 yrs 4=Had w/in 5 yrs 5=Had > than 5 yrs ago 9=Unknown/Refused'
_SIGMO3	NEVER/EVER HAD SIGMOIDOSCOPY EXAM	_COLRECA.	1=Never Had 2=Ever Had 9=Unknown/Refused'
_SIGMO4	SIGMOIDOSCOPY STATUS	_COLRECB.	1=Never had 2=Had w/in last yr 3=Had w/in 2 yrs 4=Had w/in 5 yrs 5=Had > than 5 yrs ago 9=Unknown/Refused'

Women's Health

Questions concerning knowledge and use of mammography, breast self-exam (BSE), breast physical exam (BPE), clinical breast exam (CBE) and pap test have been included in various forms on BRFSS. A careful review of the introductions, categories, and wordings for these questions is highly recommended prior to use. "Asymptomatic" women are those who reported that the exam was part of routine care, rather than for a problem or cancer, and is generally used to approximate utilization for screening purposes. Because of problems in the skip patterns in 1988 and 1989 for the variable HYSTER, it is not possible to identify all women who had hysterectomies in those two years. The variables _PAP1 and _PAP2, which assess pap smear use among women who have not had hysterectomies, are therefore set to missing for those years. In 1992, women were not asked if they had ever heard of a pap smear (PAP), requiring the creation of a new series of pap smear variables (_PAP5 - _PAP8).

Variable	Label	Format	Coding
_BPE1	NEVER/EVER HAD BPE, ASYMPTOMATIC WOMEN	_BREASTA.	1=Never Had 2=Ever Had 9=Unknown/Refused'
_BPE2	BPE STATUS, ASYMPTOMATIC WOMEN	_BREASTB.	1=Never Had 2=Had w/in 1 yr 3=Had w/in 2 yrs 4=Had w/in 5 yrs 5=Had > 5 yrs ago 9=Unknown/Refused'
_BPE3	NEVER/EVER HAD BPE, ALL WOMEN	_BREASTA.	1=Never Had 2=Ever Had 9=Unknown/Refused'

Risk Factor Variables

Responses to survey questions have been used to calculate a series of "risk factor" variables. These variables start with _RF and are coded as follows:

        1 = Not at Risk
        2 = At Risk
        9 = Unknown Risk

Part VII: Calculated Variables

Variable	Label	Description
_RFCHOL	At risk for high cholesterol	Based on response to variable LEVEL: "What is your blood cholesterol level?" Persons who report a cholesterol level above 240 are considered at risk and persons who report a level of 240 or lower are considered not at risk. Persons who report that they never had their cholesterol level checked, or were not told or cannot remember the number they were told, are set to 9 (unknown).
_RFCHIL1	High cholesterol calculated variable	
_RFDRACU	Risk for acute drinking, defined as having five or more drinks on at least one occasion during the past month	This determination is based on variable DRINKGE5: "Considering all types of alcoholic beverages, that is, beer, wine, wine coolers, cocktails, and liquor, as drinks, how many times during the past month did you have five or more drinks on an occasion?" Respondents who refused to answer DRINKANY "Have you had any beer, wine, wine coolers, cocktails, or liquor during the past month?" are not asked DRINKGE5, and are set to 9 (unknown).
_RFDRCHR	Risk for chronic drinking, defined as drinking sixty or more alcoholic beverages during the past month	This variable is based on responses to questions concerning the number of occasions during the past month when alcoholic beverages were consumed, and the average number of drinks consumed on those occasions. From answers to these questions, the average number of alcoholic beverages consumed per month is calculated (_DRNKMO). Respondents who drank sixty or more alcoholic beverages are considered at risk for chronic drinking.

Respondents who refused to answer DRINKANY "Have you had any beer, wine, wine coolers, cocktails, or liquor during the past month?" are not asked questions concerning amount and frequency of alcohol consumption, and are set to 9 (unknown) for _RFDRCHR. Respondents who could not or did not report the number of occasions on which they drank and/or the number of drinks per occasion are also set to missing for _RFDRCHR.

N.B.: From 1984 to 1988, separate questions were asked concerning consumption of beer (_NBEERMO), wine (_NWINEMO) and liquor (NLIQRMO). In 1989 and 1990, questions were asked for all alcoholic beverages combined. This change appears to have resulted in a drop in the measured prevalence of chronic drinking. Trends in chronic drinking must therefore be examined separately for 1984-1988 and from 1989 forward. |
| _RFDRCH1 _RFDRCH2 _RFDRCH3 | Risk for chronic drinking, defined as drinking sixty or more alcoholic beverages during the past month | This variable is based on responses to questions concerning the number of occasions during the past month when alcoholic beverages were consumed, and the average number of drinks consumed on those occasions. From answers to these questions, the average number of alcoholic beverages consumed per month is calculated (_DRNKMO1). Respondents who drank sixty or more alcoholic beverages are considered at risk for chronic drinking. Prior to 1993, the question DRINKANY made reference to a date one month prior to survey. In 1993, the reference to a date was dropped. DRINKANY was renamed to DRNKANY1 and to reflect this change, _RFDRCHR was renamed to _RFDRCH1. In 1995 forward, the variable is _RFDRCH2. |
| _RFDRDRI | Risk for drinking and driving, defined as driving on at least one occasion in the past month after having had too much to drink | This determination is based on DRINKDRI: "And during the past month, how many times have you driven when you've had perhaps too much to drink?" Respondents who refused to answer DRINKANY "Have you had any beer, wine, wine coolers, cocktails, or liquor during the past month?" are not asked DRINKDRI, and are set to 9 (unknown). |

Part VII: Calculated Variables

Variable	Label	Description
_RFDRHV5	Risk for heavy drinking	This determination is based on _DRNKWEK; Adult men having more than 14 drinks per week and adult women having more than 7 drinks per week
_RFRIDE	Risk of having ridden with a driver who has had too much to drink	This determination is based on RIDEDRNK: "And during the past month, how many times have you ridden with a driver who has had perhaps too much to drink?" Respondents who refused to answer DRNKANY1 "Have you had any beer, wine, wine coolers, cocktails, or liquor during the past month?" are asked RIDEDRNK and, unlike _RFDRDRI, are not set to 9 (unknown).
_RFHYPER	Blood pressure still high	Based on response to BPUPNOW: "As far as you know, is your blood pressure presently normal or under control -- or is it still high?" Respondents who report that their blood pressure is still high are considered at risk. Persons who refuse to respond or state that they don't know if their blood pressure is still high are set to 9 (unknown) for _RFHYPER. Persons who refused to answer or answered DON'T KNOW/NOT SURE to BPHIGH "Have you ever been told by a doctor, nurse, or other health professional that you have high blood pressure?" are also set to 9 (unknown).
		This question was dropped in 1990. All values for _RFHYPER for 1990 forward are set to missing.
_RFHYPE2	Ever told blood pressure high	Based on response to BPHIGH: "Have you ever been told by a doctor, nurse, or other health professional that you have high blood pressure?" Respondents who report that they have been told they have high blood pressure are considered at risk.
_RFHYPE3	Told on more than one occasion that blood pressure is high or prescribed medication for high blood pressure or blood pressure still high	Based on responses to questions HIGHGT1, BPTREAT, and BPUPNOW. Respondents who respond "more than once" to HIGHGT1, or "yes" to BPTREAT, or "still high" to BPUPNOW are considered at risk.
		BPUPNOW was dropped in 1990, making consistent coding of this variable impossible. All values for _RFHYPER3 for 1990 forward are set to missing.
_RFHYPE5	Told have high blood pressure by a doctor, nurse, or other health professional	Based on response to BPHIGH2: "Have you ever been told by a doctor, nurse, or other health professional that you have high blood pressure?"
_RFLIFES	At risk for sedentary lifestyle	Based on responses to a series of questions concerning leisure-time physical activities. Activities on which information is collected include running, jogging or walking, swimming, bicycling, calisthenics, aerobics, golf, gardening and other home activities requiring physical exertion, competitive and team sports, and outdoor recreational activities such as hiking, boating, fishing and hunting. The type, duration and frequency of the two activities most commonly engaged in over the last month is recorded.
		Based on responses to these questions, the variable _TOTINDX is created, in which exercise level is categorized as follows: 1) no activity (no exercise outside of normal work duties during the last month), 2) irregular (less than three times a week and/or less than twenty minutes per occasion), 3) regular, but not intense (at least three times a week for at least twenty minutes each occasion, but not meeting the Year 2000 Objective 4.1 for exercise), and 4) regular and vigorous (meeting Year 2000 Objective 4.1 - regular exercise which involves large muscle groups in dynamic movement performed at an intensity of 60 percent or greater of an individual's cardiorespiratory capacity). Persons with no or irregular exercise are considered to have a sedentary lifestyle.

Part VII: Calculated Variables

Variable	Label	Description
_RFREGUL	Regular and Sustained Activity Level.	Respondents who reported a physical activity or pair of physical activities that were done for 30 minutes or more per session, five or more times per week, regardless of intensity are coded as "At Risk". Respondents who reported no activity or activity less than this amount are coded as "not at risk." Measures Year 2000 Objective 1.3.
_RFOBESE	At risk for overweight, defined as 120% or more of ideal weight based on the mid-value of the medium frame person on the 1959 Metropolitan Life Insurance Company height/weight tables	The reported height and weight of the individual are used to determine the weight for height percent of median (_WTFORHT), which is then used to calculate _RFOBESE.
_RFSECND	At risk for exposure to second-hand smoke	This variable is calculated by CDC, but not by California. Based on the smoking status of the respondent and all enumerated adults (SMOKE1-SMOKE9). _RFSECND has a value of "1" if the respondent is a non-smoker and all enumerated adults are coded as non-smokers; it has a value of "2" if the respondent or any enumerated adults are current smokers; it has a value of "9" if none of the adults (respondent or enumerated adults) are smokers, but the smoking status of at least one is unknown or refused. _RFSECND is set to missing if the participant was a non-smoker, the variable NUMADULT was greater than one, and values for all enumerated adults were set to missing.
_RFSEATB _RFSEAT2 _RFSEAT3	Wear seatbelts seldom or never Wear seatbelts sometimes, seldom or never Seatbelt non-use	These risk factor variables related to seat belt use are based on responses to SEATBELT: "How often do you use seat belts when you drive or ride in a car? Would you say always, nearly always, sometimes, seldom, or never?" Respondents who state that they wear seat belts "sometimes" are considered not to be at risk under _RFSEATB or _RFSEAT3, and are considered at risk under _RFSEAT2. For both definitions, respondents who state that they never ride in cars are considered "not at risk."
_RFSMOKE _SMOKER	At risk due to smoking Smoking status	Participants are asked if they have smoked 100 cigarettes (SMOKE100), and if so, if they currently smoke (SMOKENOW), and if they currently smoke, the number of cigarettes smoked per day (SMOKENUM). The variable _SMOKER uses these three questions to categorize persons as current smokers, former smokers, never smokers, and irregular smokers. Irregular smokers are those who stated that they currently smoke, but responded DON'T smoke regularly" to SMOKENOW. _RFSMOKE considers both current and irregular smokers as being "at risk" for smoking.
_RFTOBAC _SMKLESS	At risk for smokeless tobacco use Smokeless status	Questions on smokeless tobacco use were asked in 1987 and 1988 only. Persons who currently use chewing tobacco, snuff, or both are considered at risk. The variable _SMKLESS uses these three questions to categorize persons as current user, former user, never used.

Part VII: Calculated Variables

Variable	Label	Description
_RFWHBMI	At risk for overweight based on body mass index based on old standards	Body mass index is calculated from the reported height and weight of the individual according to the following formula: _BMI = weight in kg/[(height in m)2]
_RFBMI2	At risk for overweight based on body mass index based on 1999 standards	Male respondents were considered overweight if they had a BMI of 27.8 or higher, while females were considered overweight if they had a BMI of 27.3 or higher. These values represent the sex-specific 85th percentile of BMI for U.S. adults 20 and 29 years of age as determined by the Second National Health and Nutrition Examination Survey (NHANES-II), conducted by the National Center for Health Statistics between 1976 and 1980. Respondents are considered normal weight if they had a BMI between 18.5-24.9, over weight if they had a BMI between 25.0-29.9 and obese if they had a BMI of 30.0 or higher. For the variable _RFBMI2 the respondents are at risk if they have a BMI of 25.0 or higher. These values are from the Executive Summary of Clinical Guidelines on the Identification, Evaluation, and Treatment of Overweight and Obesity in Adults; National Heart, Lung and Blood Institute, 1998.

Part VIII: Unweighted Demographic Cumulative Frequencies

Table V.a

Sample (1984-2020)

Year	Frequency	Percent	Cumulative Frequency	Cumulative Percent
1984	1,086	0.44%	1,086	0.44%

*Beginning in 2014, respondents were allowed to participate in the survey when answering "don't know" or "refused" to race/ethnicity.
**Education is missing because out of state resident CA cell phone respondents (included in 2014 for the first time) do not answer the CA education question

PART IX: AAPOR RESPONSE RATES

Table VI.a

Summary of Calling Outcomes 2019

Category	Frequency
Interview (Category 1)	
Complete (1.1)	9,006
Partial (1.2)	2,237
Eligible, non-interview (Category 2)	
Refusal and Break off (2.1)	4,083
Other, non-contact (2.2)	544
Physically or mentally unable/incompetent (2.3)	106
Language barrier (2.3)	77
Unknown eligibility, non-interview (Category 3)	
Unknown if private residence (3.1)	64,297
No answer (3.1)	14,467
Answering machine-don't know if household (3.1)	67,097
Call blocking (3.1)	4,106
Housing unit, unknown if eligible respondent (3.2)	2,184
Unknown if person is HH resident (3.3)	0
Other (3.9)	0
Not eligible (Category 4)	
Out of sample - does not live in California, no eligible respondent (4.1)	4,147
Fax/data line (4.2)	3,353
Non-working/disconnect (4.3)	209,381
Special technological circumstances (4.4)	29,519
Call forwarding (4.4)	1
Cell phone in landline sample, OR landline in cell phone sample (4.4)	296
Nonresidence (4.5)	13,230
Business, government office, other organizations (4.5)	0
No eligible respondent (4.7)	0
Other (4.9)	0
Total phone numbers used	428,041

Table VI.b

Response and Cooperation Rates 2019[31]

	Rate formula	Frequency/Rate
Totals used to rates		
I=Complete Interviews (1.1)		9,006
P=Partial Interviews (1.2)		2,237
R=Refusal and break off (2.1)		4,083
NC=Non-Contact (2.2)		544
O=Other (2.3)		183
Response Rate 1	I/(I+P) + (R+NC+O) + (UH+UO)	5.4%
Response Rate 2	(I+P)/(I+P) + (R+NC+O) + (UH+UO)	6.7%
Response Rate 3	I/((I+P) + (R+NC+O) + e(UH+UO))	36.2%
Response Rate 4[32]	(I+P)/((I+P) + (R+NC+O) + e(UH+UO))	45.2%
Cooperation Rate 1	I/(I+P)+R+O)	58.1%
Cooperation Rate 2	(I+P)/((I+P)+R+0))	72.5%
Cooperation Rate 3	I/((I+P)+R))	58.8%
Cooperation Rate 4	(I+P)/((I+P)+R))	73.4%

---

[31] All calculations were done using AAPOR's Standard Calculator and AAPOR's Standard Definitions and Eligibility Calculation documents available at http://www.aapor.org.

[32] "e", is the estimated proportion of cases of unknown eligibility that are eligible. This estimate is based on the proportion of eligible units among all units in the sample for which a definitive determination of status was obtained (a conservative estimate). For the calculations in this table, e was estimated to be 1.7% (sum of Categories 1 and 2 / sum of Categories 1, 2 and 4).
