

36 Primary standards are used to calibrate instrumentation and reagent solutions such as titrants. If the composition of the standard is not ~~is~~ known, then experimental results will not be accurate.

37 The equivalence point has been reached when all of the analyte has been titrated. The end point occurs ~~at~~ usually when a slight excess of titrant causes a physical change in the solution that can be detected.

39 In a direct titration the analyte is titrated directly by the titrant.

In a back titration a known excess of titrant is added to the analyte. The then excess titrant is titrated using a second titrant.

$$43.0 \text{ mL} \left| \frac{0.0400 \text{ mol Hg}_2^{2+}}{1000 \text{ mL}} \right| \frac{2 \text{ mol I}^-}{1 \text{ mol Hg}_2^{2+}} \left| \frac{1000 \text{ mL}}{0.100 \text{ mol I}^-} \right| =$$

32.0 mL

$$(44) \quad 1.67 \text{ mg NH}_3 \left| \frac{\text{mmol NH}_3}{17.031 \text{ mg}} \right| \left| \frac{3 \text{ mmol OBr}^-}{2 \text{ mmol NH}_3} \right| = \frac{0.149 \text{ mmol OBr}^-}{1.00 \text{ mL}}$$

$$= 0.149 \text{ M OBr}^-$$

$$(46) \quad 10.00 \text{ mL HCl} \left| \frac{1.396 \text{ Mol}}{1000 \text{ mL}} \right| = 0.01396 \text{ mol H}^+ \text{ added}$$

$$39.96 \text{ mL NaOH} \left| \frac{0.1034 \text{ mol}}{1000 \text{ mL}} \right| = 0.004012 \text{ mol OH}^- \text{ needed for back titration}$$

$$\begin{array}{r} 0.01396 \\ - 0.004012 \\ \hline \end{array}$$

0.00995 mol of H^+ to titrate CO_3^{2-}

$$0.00995 \text{ mol H}^+ \left| \frac{1 \text{ mol CaCO}_3}{2 \text{ mol H}^+} \right| \left| \frac{100.086 \text{ g CaCO}_3}{1 \text{ mol CaCO}_3} \right| = \frac{0.498 \text{ g CaCO}_3}{0.5413 \text{ g limestone}} \times 100$$

$$= 92\%$$

Ch 10: (58)

$$\frac{5.00 \text{ mL HCl}}{1 \text{ mL}} \left| \frac{0.0336 \text{ mmol}}{1 \text{ mL}} \right| = 0.168 \text{ mmol H}^+$$

$$\frac{6.34 \text{ mL NaOH}}{1 \text{ mL}} \left| \frac{0.010 \text{ mmol}}{1 \text{ mL}} \right| = 0.0634 \text{ mmol OH}^-$$

$$0.1046 \text{ mmol excess H}^+ = 0.1046 \text{ mmol nitrogen} \left| \frac{14.007 \text{ mg}}{1 \text{ mmol}} \right| = 1.465 \text{ mg N}$$

$$\frac{256 \text{ } \mu\text{L}}{10^3 \text{ } \mu\text{L}} \left| \frac{37.9 \text{ mg}}{1 \text{ mL}} \right| = 9.707 \text{ mg protein}$$

$$\frac{1.465 \text{ mg}}{9.707 \text{ mg}} \times 100 = 15.1\% \text{ N by mass}$$
