This is how I got it to work on Windows ME.

Added the following line to the [compatibility95] section of win.ini.
Start menu, Run, open MSCONFIG, and change win.ini. Or, just edit it directly
in your windows/system directory.

```
Jrew=0x00080000
```

Reboot the Computer.
Install Oracle 8i. It should install correctly this time.

After Oracle setup is complete, Oracle will recommend a reboot.
There is one additional step necessary prior to reboot;
Oracle may add a non-standard path statement to the
autoexec.bat file.

Please modify this SET PATH
statement to use short-filenames if you find a quoted
LFN string represented as part of the path. You can
confirm that the path was merged successfully into the
registry after reboot by examining the PATH variable
in the registry at

```
HKLM\System\CurrentControlSet\Control\SessionManager\Environment
```

Symptoms of a missing Oracle path statement in the registry are that Net8 Easy Config will not launch.

Please note that Oracle does not support the use of this
product in Windows ME, but have authorized these workarounds
for testing purposes only.
